GRAIN DUST EXPOSIONS DOWN IN 1991*

Only twelve grain dust explosions were recorded in the U.S. in 1991 according to data compiled by Ralph Regan, FGIS Safety Director, and Robert W. Schoeff, Marketing and Safety Specialist, Kansas State University. This compares to 15 in 1990 and a ten-year average of 16 explosions.

There was one fatality compared to none in 1990 and two in 1989. Four injured is a record low number.

For the first time in many years, grain elevators were not the predominate location of the grain dust explosions, four out of 12, with four occurring in feed mills and one each in flour and rice mills and starch and cereal plants.

The elevator leg continued as the principal location of the primary explosions with five, compared to four in bag dust collectors.

The probable cause was fire originating in a hammermill in three cases, three were unknown, and two were from friction sparks.

Fuel sources were identified as corn (5), followed by wheat, wheat gluten, wheat screenings, wheat mids, rice flour, barley, and oats.

Grain dust explosions occurred in nine states across the country: four in Iowa, and one (each in Arkansas, Georgia, Indiana, Kansas, Nebraska, Ohio, Virginia, and Washington.

Estimated property damage was a record low of \$289,000 for the 12 grain dust explosions.

There was one agricultural related dust explosion at the American Crystal Sugar Co. plant in Hillsboro, North Dakota on February 2, 1992 that injured two and damaged the sugar load-out facilities.

Each year appreciation is expressed to the many persons who willingly provide the information that allows us to build a data base on grain dust explosions that does not exist in any other industry in the U.S.
