# 2012 WHEAT CROP REVIEW

## Weather and Crop Development

Following the drought-stricken conditions of 2011, the 2011-2012 Kansas wheat crop flourished early on for the most part due to a mild winter and normal precipitation levels. The spring months brought unseasonably warm temperatures and scattered rain showers throughout the state. As the crop neared maturity, the weather settled into hot, dry conditions that were record-breaking in some locations: May 2012 ranks as the third warmest on record for Kansas. Many wheat producers determined that their wheat had died and shriveled from the heat and lack of moisture before it had the chance to ripen, leading to wide fluctuations in test weight and quality even within the same field.

Because of the mild winter and above-normal temperatures in the spring, the development of the 2011-2012 wheat crop progressed at an extremely accelerated pace for most of the season. The 2012 wheat harvest—two to three weeks early for most of the state—also ranks as the earliest on record for Kansas.

The quality of the 2011-2012 wheat crop reflected the range of conditions during the growing season; 40% of the crop was rated as good or excellent, 36% rated as fair, and 24% was rated as poor to very poor. (*Crop Progress and Conditions* report, Kansas Agricultural Statistics)

## Diseases

Stripe rust was a serious problem in Kansas during the 2012 growing season. Severe stripe rust developed on varieties that were resistant to stripe rust in previous years, including some of the most widely grown varieties in the state. Stripe rust was a problem in nearly all areas of the state, and many growers responded to the emerging threat of disease with foliar fungicide applications. Hot, dry weather slowed the development of stripe rust in some areas, but in many cases this was not enough to avoid the disease. In some counties, more than 50% of the wheat acres were treated with a fungicide application. While these applications likely prevented much of the potential yield loss to stripe rust, they also significantly added to the production costs for many farmers.

Barley yellow dwarf (BYD) was also a significant problem central and eastern Kansas in 2012. The outbreak of BYD this year makes for three consecutive years that this viral disease has been a problem for wheat producers in the state.

Wheat streak mosaic (WSM) was reported in most areas of the state this year. Historically, wheat streak mosaic is most common in western Kansas and localized problems were reported in northwest Kansas again this year. WSM was reported in central KS also with severe outbreaks in Clay, Cloud, Dickinson, McPherson, Saline, and

Washington Counties. (Erick De Wolf and Bill Bockus, Kansas State University Plant Pathologists)

## Insects

Very few problems were reported from planting until winter dormancy throughout the state. A few fall army cutworm infestations occurred in south central Kansas, but timely rains helped plants compensate for the larval feeding, so treatments were not required. Chinch bugs caused much concern in the spring because there were many areas in south central and north central Kansas that had adult infestations sufficient to cause considerable thinning, especially coupled with the dry weather. Areas of wheat streak mosaic and barley yellow dwarf infections were noted in different parts of the state, but levels were probably about average. No Hessian fly outbreaks were noted, but this pest continues at about 1% infestation levels in most fields sampled throughout the state. (Jeff Whitworth, Kansas State University Extension Entomologist)

## Harvest Statistics

The Kansas Agricultural Statistics June 12 estimate of the 2012 crop was 387.0 million bushels from 9.0 million acres, up significantly from the 2011 wheat crop and the largest area harvested since 2006. If realized, this will be the highest production since 2003. Yield per harvested acre is expected to average 43 bushels, up 8 bushels from last year's final yield. (June 12, 2012, *Crops Report*, Kansas Agricultural Statistics)

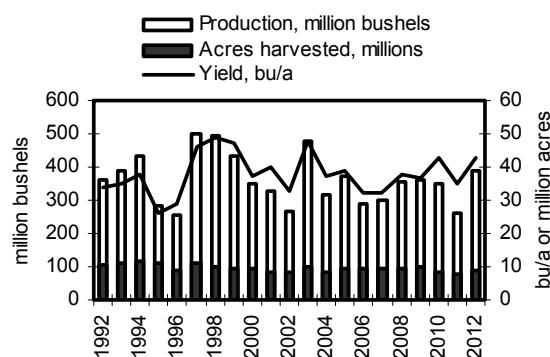

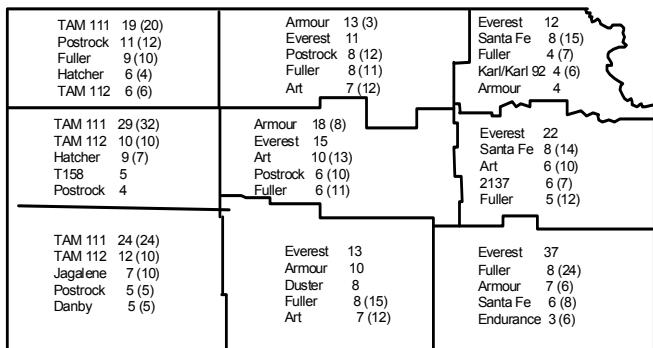

Figure 1. Historical Kansas wheat production

TAM 111 held on as the leading variety of wheat seeded in Kansas. It accounted for 12.6% of the state's wheat and was the most popular variety in the western third of the state. Everest jumped up 14 spots to second with 8% of acreage. Armour moved into third place with 7.5%. Fuller

dropped to fourth place, accounting for 5.5% of wheat acres. TAM 112 came in fifth at 5.2%. (February 1, 2012, *Wheat Variety*, Kansas Agricultural Statistics)

## Acreage Distribution

**Figure 2. Leading wheat varieties in Kansas  
Percentage of seeded acreage for 2012 and (2011) crops**

## 2012 PERFORMANCE TESTS

The Kansas Agricultural Experiment Station annually compares both new and currently grown varieties in the state's major crop-producing areas. These performance tests generate unbiased performance information designed to help Kansas growers select wheat varieties suited for their area and conditions.

Site descriptions and management practices for each site are summarized in Table 3. One-year or one-location results can be misleading because of the possibility of unusual weather or pest conditions.

## Environmental Factors

Heat damage and severity of strip rust were determining factors in many of the tests in the 2011-2012 growing season. **Be sure to keep extenuating environmental conditions in mind when examining test results.**

## Varieties

Public varieties are selected for inclusion in the tests on the basis of several criteria. Most represent new or established varieties from Nebraska, Oklahoma, and Colorado with potential for successful use in Kansas. Some are included as long-term checks. Others are entered at the request of the originating institution. Twenty-four public wheat varieties were entered for testing.

Originators or marketers enter privately developed varieties on a voluntary basis. Entrants choose both the entries and test sites. The 2012 private entrants are listed

in Table 1. Eleven entrants provided a total of 32 varieties for testing.

Table 13 describes the characteristics of seed submitted for testing. Seed quality—including factors such as size, purity, and germination—can be important in determining the performance of a variety. Wheat seed used for entries in the Kansas Crop Performance Tests is prepared professionally and usually meets or exceeds Kansas Crop Improvement Certification standards. Performance of a given variety similar to that obtained in these tests is best assured under similar environmental and cultural conditions and with the use of certified or professionally prepared seed.

## Results and Variety Characterization

Results from Kansas tests are presented in Tables 4 through 12. Yields are reported as bushels per acre (60 lb/bu) and are adjusted to a moisture content of 13% where moistures were reported at harvest. Yields also are converted to percentages of the test average to speed recognition of highest-yielding entries. Multi-year averages are presented for those varieties entered more than 1 year.

Additional information such as test weight, heading date, and plant height is helpful for fine-tuning variety comparisons. Planting varieties with a range of maturities helps minimize weather risks.

At the bottom of each table is the (0.05) LSD (least significant difference) for each column of replicated data. One can think of the LSD as a “margin of error” that shows how big the difference between two varieties must be for one to be 95% confident that the difference is real. The use of the LSD is intended to reduce the chance of overemphasizing small differences. Small variations in soil structure, fertility, water-holding characteristics, and other test-site characteristics can cause considerable yield variation among plots of one variety.

## Electronic Access

To access crop performance testing information electronically, visit the website at: <http://www.agronomy.ksu.edu/kscpt>

## Research and Duplication Policy

When companies submit entries, permission is given to Kansas State University to test varieties and/or hybrids designated on the entry forms in the manner indicated in the test announcements. Seed submitted for testing should be a true sample of the seed being offered for sale.

All results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety,

provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1072 '2012 Kansas Performance Tests with Winter Wheat Varieties,' or the Kansas Crop Performance Test website, <http://www.agronomy.ksu.edu/kscpt> for details. Endorsement or recommendation by Kansas State University is not implied."

Brand names appearing in this publication are for product identification purposes only. No endorsement is intended, nor is criticism implied of similar products not mentioned.

<sup>1</sup> Varieties and percentage seeded acreage from the Feb. 3, 2012, wheat variety survey, Kansas Agricultural Statistics, Topeka, KS.

2 Most ratings are estimates based on information and observations from many sources over several years. Agronomic information by Joe Martin - Hays, and Allan Fritz, Jim Shroyer, and Steve Watson - K-State Agronomy.

<sup>3</sup> Summary of crop performance test results from recent years

<sup>4</sup> Ratings from Rebecca Miller - K-State Wheat Quality Laboratory

EX = Exceptional: large kernels; high protein content; very good milling, mixing, and commercial bread-baking.

LD = Less Desirable: one or more serious quality defects

-- = Inadequate information or conflicting data

AC = Acceptable; milling and baking attributes acceptable, but not outstanding, for all properties; may have minor defects.

**5** Ratings by Allan Fritz - Manhattan, Joe Martin - Hays, Erick DeWolf and Bill Rockus - K-State Plant Pathology, Phil Sloderbeck - K-State Entomology

Final ratings and descriptions of disease and insect pests are available in "Wheat Variety Disease and Insect Pest Resistance Ratings".

Final ratings and descriptions of disease and insect pests are available in **Wheat Variety Disease and Insect Ratings 2012**,  
6 New Russian wheat aphid biotype is thought to be virulent on all currently available commercial varieties.

<b>Region and location</b>	<b>Soil type previous crop</b>	<b>N</b>	<b>P<sub>2</sub>O<sub>5</sub></b>	<b>K<sub>2</sub>O</b>	<b>Plant-harvest seed rate</b>	<b>Conditions</b>
<b><u>Northeast Dryland</u></b>						
Ashland Agronomy Farm Manhattan (MA)	Reading silt loam Soybean	70	--	--	Fall 75 lb/a	Decent conditions early in the season, but dry from May until harvest.
<b><u>Southeast Dryland</u></b>						
East Central KS Experiment Field Ottawa (OT)	Woodson silt loam Grain sorghum	94	35	15	Fall 60 lb/a	Generally favorable conditions. Most varieties had some BYD but survived to finish with good yields.
Southeast Agricultural Research Center Parsons (PA)	Parsons silt loam Corn	30	15	25	Fall 75 lb/a	Excellent stands for all varieties, very good fall tillering, no insects.
<b><u>Soft Wheat</u></b>						
Southeast Agricultural Research Center Parsons (PA)	Parsons silt loam Corn	30	15	25	Fall 75 lb/a	Excellent stands for all varieties, very good fall tillering, no insects.
<b><u>North Central Dryland</u></b>						
North Central KS Experiment Field Belleville (BE)	Crete silt loam Fallow	80	30	--	Fall 90 lb/a	Good planting conditions. Very mild winter. Very hot and dry late spring until harvest.
North Central KS Farmer's Field Beloit (BL)	Harney silt loam Wheat	108	83	--	Fall 80 lb/a	Good planting conditions. Very mild winter. Very hot and dry late spring until harvest.
<b><u>Central Dryland</u></b>						
Central KS Farmer's Field Gypsum (GY)	Silty clay loam Fallow	40	--	--	Fall 90 lb/a	Mild winter. Very dry late spring until harvest.
Central KS Farmer's Field Lorraine (LR)	McCook silt loam Fallow	60	--	--	Fall 60 lb/a	Dry conditions led to increased variability.
<b><u>South Central Dryland</u></b>						
South Central KS Farmer's Field McPherson (MC)	Crete silt loam Fallow	60	--	--	Fall 60 lb/a	Earlier-maturing varieties had the advantage because they avoided heat stress and dry conditions later on.
South Central KS Experiment Field Hutchinson (HU)	Ost silt loam Fallow	125	40	--	Fall 60 lb/a	Earlier-maturing varieties had a similar advantage at Hutchinson.
South Central KS Farmer's Field Conway Springs (CW)	Sandy loam Fallow	40	--	--	Fall 60 lb/a	Same as McPherson and Hutchinson.
<b><u>Northwest Dryland</u></b>						
Agricultural Research Center Hays (HA)	Harney silt loam Fallow	80	--	--	Fall 50 lb/a	Good establishment in the fall. Winter was mild with increased moisture.
Northwest Research-Extension Center Colby (CO)	Keith silt loam Fallow	60	--	--	Fall 60 lb/a	Very dry at planting with non-uniform stands until it rained 10 days later. Winter was mild and dry.
Northwest Research-Extension Center Tribune (TR)	Richfield silt loam Grain sorghum	85	25	--	Fall 55 lb/a	Decent conditions early in the season, but dry from mid-April until harvest. Some stripe rust observed.
<b><u>Southwest Dryland</u></b>						
Southwest KS Farmer's Field Larned (LA)	Harney clay loam Fallow	75	--	--	Fall 50 lb/a	Dry.
Southwest KS Farmer's Field Dodge City (DC)	Harney clay loam Fallow	60	--	--	Fall 45 lb/a	Very dry.
Southwest Research-Extension Center Garden City (GC)	Keith silt loam Fallow	60	--	--	Fall 65 lb/a	Very dry. Abandoned.
<b><u>Western Irrigated</u></b>						
Northwest Research-Extension Center Colby (CO)	Keith silt loam Fallow	110	--	--	Fall 90 lb/a	Good stands were established. Winter was mild and dry.
Agricultural Research Center Hays (HA)	Harney silt loam Fallow	80	--	--	Fall 80 lb/a	Good establishment in the fall. Winter was mild with increased moisture.
Southwest Research-Extension Center Garden City (GC)	Keith silt loam Corn	80	--	--	Fall 75 lb/a	Adequate moisture.
Western KS Farmer's Field Scott City (SC)	Scott silt loam Fallow	90	--	--	Fall 80 lb/a	Decent conditions early in the growing season, but dry from mid-April until harvest.

# **2012 National Winter Canola Variety Trial**

## **Senior Authors**

Michael Stamm and Scott Dooley

Department of Agronomy, Kansas State University, Manhattan,

## **Other Contributors**

Johnathon Holman, Kansas State University, Garden City

Randall Nelson, Kansas State University, Belleville

## **Cooperating Producers**

Bob Schrock, Kiowa, KS

## **Objectives**

Objectives of the National Winter Canola Variety Trial (NWCVT) are to evaluate the performance of released and experimental varieties, determine where these varieties are best adapted, and increase visibility of winter canola across the nation. Breeders, marketers, and producers use data collected from the trials. The NWCVT is planted at locations in the Great Plains, Midwest, northern United States, and Southeast.

## **Procedures**

Seed for the NWCVT was distributed to 47 cooperators in 22 states for the 2011-2012 growing season. Of the 45 entries, 29 are commercially available in the United States and 16 are experimental. These entries were provided by 11 global seed suppliers. All entries in the trial were treated with either Helix XTra or Prosper FX seed treatments to control insects and diseases through the late fall and early winter months.

Management guidelines were provided to cooperators, but previous growing experience influenced final management decisions. Agronomic information, site descriptions, and growing conditions are given along with performance data for each harvested location. All trials were planted in small research plots (approximately 100 ft<sup>2</sup>) with three or four replications. Yield results for some locations include 2-year summaries. Results are listed alphabetically by seed supplier. The

“percentage of test average” calculation is a relative yield calculation allowing for some comparison of performance across environments. Entries yielding more than 100 percent of the test average across multiple locations merit some consideration. Caution should be used when evaluating data from locations with coefficient of variation (CV) values greater than 20. Lower values suggest less error was observed at the location. Inestimable differences in soil type, weather, and environmental conditions play a part in increasing experimental error and CV values.

## **Test Locations**

Of the seven NWCVT sites planted in Kansas, six were harvested. Four trials are included in this report: Belleville, Garden City, Kiowa, and Manhattan. Andale and Marquette received hail damage on the windrow before harvest, so the data are unreliable. Hutchinson was lost to poor fall establishment because of dry soils. Overall yields were excellent and above average in Kansas. Yields are reported in lb/acre. Canola weighs 50 lb/bushel, so a 2,000 lb/acre yield is 40 bushels/acre.

## **2011-2012 Growing Conditions**

Temperature and precipitation data are shown at the top of the page for each location. Thick black lines on the temperature graphs represent long-term average high and low temperatures (°F) for the location. The upper thin line represents actual daily high temperatures, and

the lower thin line represents actual daily low temperatures. On the precipitation graph, the line labeled “normal” represents long-term average precipitation, and the line labeled “11-12” represents actual precipitation.

In general, the 2011-2012 growing season saw above normal temperatures and normal to below normal precipitation. The above normal temperatures resulted in virtually no winter stand loss. Yield potential was very high throughout the growing season because the crops produced much aboveground biomass. Severe storms caused yield losses at Andale and Marquette (not reported) after the crop had been swathed just before harvest. At Kiowa, severe lodging was observed when a thunderstorm occurred at a vulnerable period of grain fill.

Even so, winter canola is consistently achieving high seed yields where moisture is not limiting and severe weather is avoided. Garden City has averaged 2,300 lb/acre for three consecutive years, with some varieties exceeding 3,000 lb/acre. Belleville produced some of the highest dryland winter canola yields ever reported in Kansas. The field average was 3,978 lb/acre, and the highest average yield was 4,845 lb/acre.

### Variety Selection

Winter hardiness is an important trait to consider when selecting a winter canola variety. This trait has been improved over the past several years, but variability still exists where differential winterkill occurs. Winter canola varieties should show consistent survival across multiple years and locations. Other traits to consider include herbicide resistance, tolerance to carryover from sulfonylurea herbicides, maturity, disease tolerance, lodging tolerance, and yield potential. Use more than one year of variety trial data to make an informed variety selection decision.

Some locations include High Erucic Acid Rapeseed (HEAR). By definition, HEAR is not canola because it produces greater than 2% erucic acid in the processed oil. The harvested grain cannot be mixed with canola grain, and the oil can be used only for industrial purposes. If HEAR is commercially grown, it will be under contract and a delivery point will be secured before planting.

Table 1 identifies the seed sources, developers and marketers, and traits of the winter canola

varieties and hybrids grown in the NWCVT.

### Acknowledgments

This work was partially funded by the Supplemental and Alternative Crops Competitive Grants Program, which is administered by the U.S. Department of Agriculture-National Institute of Food and Agriculture, and the Kansas Agricultural Experiment Station. Assistant scientist Scott Dooley and student workers assisted with organizing, packaging, planting, harvesting, and data collection. Sincere appreciation is expressed to all participating researchers and seed suppliers who have a vested interest in expanding winter canola acres and increasing production in the United States.

Contains greater than 2% erucic acid in the processed oil. Can be used only for industrial purposes. HEAR is not canola.

### Belleville, Kansas

Randall Nelson  
Kansas State University

Planted: 9/7/2011 at 5 lb/a in 9-in. rows  
 Swathed: 6/5/2012  
 Harvested: 6/12/2012  
 Herbicides: Treflan, Assure II  
 Insecticides: None  
 Irrigation: None  
 Previous Crop: Wheat  
 Soil Test: P=34 ppm, K=438 ppm, pH=6.2  
 Fertilizer: 30-30 lb N-P-K fertilizer in fall  
 60-0-0 lb N-P-K fertilizer in spring  
 Soil Type: Crete silt loam  
 Elevation: 1530 ft      Latitude: 39° 48'N

Comments: This is the first canola plot planted at Belleville since 1997. Exceptional yields were recorded at this dryland location. The crop looked impressive throughout the entire growing season. Temperatures were above normal, but moisture was below normal. A soil test revealed 29 lb/acre available N before planting.

### Garden City, Kansas

Johnathon Holman  
Kansas State University

Planted: 9/7/2011 at 5 lb/a in 8-in. rows  
 Harvested: 6/19/2012  
 Herbicides: Prowl 3 pt/a  
 Insecticides: None  
 Irrigation: 16.05 in.  
 Previous Crop: Corn  
 Soil Test: P=38 ppm, K=sufficient, pH=8.0  
 Fertilizer: 0-0-0 N-P-K fertilizer in the fall  
 110-0-0 N-P-K fertilizer in the spring  
 Soil Type: Ulyssess-Richfield silt loam  
 Elevation: 2835 ft Latitude: 37° 99'N

Comments: Temperatures were well above normal and precipitation was below normal during the growing season. Plants grew vigorously in the fall and there was no winterkill. Shattering was observed before harvest; however, the losses did not impact yields significantly. The plot average has been 2,300 lb/acre for three consecutive years.

### Kiowa, Kansas

Bob Schrock

Planted: 9/28/2011 at 5 lb/a in 9-in. rows  
 Swathed: 5/15/2012  
 Harvested: 5/21/2012  
 Herbicides: Assure II  
 Insecticides: Spring application for variegated cutworm  
 Irrigation: None  
 Previous Crop: Wheat  
 Soil Test: P=sufficient, pH=6.2  
 Fertilizer: 65-0-0 lb N-P-K fertilizer in fall  
 25-0-0-10 lb N-P-K-S fertilizer in spring  
 Soil Type: Pond Creek silt loam  
 Elevation: 1300 ft Latitude: 36° 58'N

Comments: The crop had high yield potential throughout the growing season. Above normal temperatures rapidly advanced plant development. Severe lodging was present after a thunderstorm hit at a vulnerable period of grain fill. Stem canker lesions were present at flowering and some stem girdling was observed.

**Table 4. Results for the 2012 National Winter Canola Variety Trial at Kiowa, KS**

Michael Stamm and Scott Dooley  
Kansas State University

Planted: 9/15/2011 at 5 lb/a in 9-in. rows  
Harvested: 6/13/2012  
Herbicides: Treflan, Assure II  
Insecticides: None  
Irrigation: None  
Previous Crop: Soybean  
Soil Test: P=43 ppm, K=212 ppm, pH=7.0  
Fertilizer: 0-0-0 lb N-P-K fertilizer in fall  
50-0-0-30 lb N-P-K-S fertilizer in spring  
  
Soil Type: Belvue silt loam  
Elevation: 1034 ft Latitude: 39° 08'N

### Manhattan, Kansas

Comments: No fall N application was made because of 150 lb/acre N available based soil tests. The third replication was dropped because of poor establishment. The trial was replanted on 10/3/12 with little improvement in stand. Above normal temperatures resulted in 100% winter survival.

Excerpts from the  
University Research Policy Agreement with Cooperating Seed Companies

Permission is hereby given to Kansas State University (KSU) to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1072, '2012 Kansas Performance Tests with Winter Wheat Varieties,' or the Kansas Crop Performance Test website, [www.agronomy.ksu.edu/kscpt](http://www.agronomy.ksu.edu/kscpt), for details. Endorsement or recommendation by Kansas State University is not implied."
