2018 KANSAS SOYBEAN PERFORMANCE TESTS

STATEWIDE GROWING CONDITIONS

The 2018 soybean season had a very distinct weather pattern with a very challenging end of the season. Early-season wet conditions slightly delayed planting during the early side of the crop planting window. Early growth was slow as impacted for wet soil conditions. Delay on planting date may cause yield reductions, primarily under high-yielding environments (>70 bushels per acre).

During the growing season, flooding was an issue in many locations, with the south central and northeast divisions particularly hard hit. Wet conditions early in the season saturated soils, resulting in inhibited root growth, leaf area expansion, increased production issues related to root compaction, and produced yellow leaves. Flooding later in the season, September and October, contributed to lodging issues. Hail was also a problem across the state. There were 526 reports of large hail during the season. Of those events, 223 were reported in May. Hail has a larger impact when it occurs later in the season, September-early October during the grain filling, when the plant depends on the leaves, potentially affecting seed set (both seed number and weight).

As related to the precipitation conditions, all divisions averaged above normal for the period of April 1 through October 15 (Table 1). The greatest departure was in the Southwest, where the divisional average was 23.87 inches or 154% of normal. Unfortunately, the rains weren't evenly distributed across the region or across the season.

For soybean, temperatures weren't as much of a factor. The warmest readings were seen in mid-July, with the highest read of 112°F reported on July 21 at Ashland, Clark County. The biggest factor was the rapid switch from much colder than average temperatures to much warmer temperatures. State-wide average temperatures in April were the coldest since 1895, while state-wide average temperatures in June were the warmest. The first autumn freezes were near average, with Colby dropping to 27°F on the 14th of October, and Concordia reaching 27°F on the 15th.

Luckily, the below-freezing temperatures did not greatly affect soybean since only small specific areas cultivated with soybean were affected (primarily north central and northwest Kansas). Temperatures below 32°F, more absolute temperature than duration of the cold stress, will affect the crop. Necrosis of the leaf canopy is a visible symptom of freeze damage in soybeans. Early grain filling impact and timing of the freeze effect will proportionally produce more yield reduction (via seed set) than if the cold stress takes place close to the end of the season.

Reproductive temperature and precipitation conditions were favorable for seed filling process. Late-season rainy conditions delayed harvest, challenging the harvest progress in some areas. Large parts of the soybean growing areas in Kansas presented poor quality soybeans (due to high levels of Phomopsis and other fungal species) that are being either severely discounted or outright refused at the elevator due to the potential for reducing in feed value.

Table 1. 2018 temperatures by crop production district

Division	Extreme Tmax (°F)	Date	Avg Tmax (°F)	Avg Tmin (°F)	Avg Tmean (°F)	Extreme Tmin (°F)	Date
Northwest	104	16-Jun	79.2	51.7	65.5	4	7-Apr
North central	105	29-Jun	78.8	53.4	65.9	4	7-Apr
Northeast	106	28-Jun	79.0	55.7	67.4	12	7-Apr
West central	107	16-Jun	82.0	53.6	67.8	11	8-Apr
Central	107	28-Jun	82.2	57.1	69.6	8	8-Apr
East central	104	29-Jun	81.2	59.0	70.1	15	8-Apr
Southwest	112	21-Jul	83.0	54.8	68.9	14	7-Apr
South central	103	1-Sep	82.1	57.6	69.8	13	7-Apr
Southeast	103	20-Jul	80.7	59.1	69.9	17	16-Apr

Despite the previously mentioned challenges, the U.S. Department of Agriculture forecasted in November a soybean yield of 42 bushels per acre for the 2018 season. This accounts for a 5 bushel per acre increase compared to the final yield recorded for the 2017 growing season. There was an overall increase in production of about 6 million bushels more at the state-level due to the overall increase in yield per unit area, with a slight reduction in the acreage relative to the 2017 season (Ignacio A. Ciampitti, Kansas State University Cropping Systems Specialist, and Mary Knapp, Kansas State University Climatologist).

TEST OBJECTIVES AND PROCEDURES

Soybean performance tests are conducted each year to provide information on the relative performance of new and established varieties and brands at several locations in Kansas.

Seeds for tests are from private seed companies, certified growers, and agricultural experiment stations (Table 1). Seed quality, including factors such as purity and germination, can be important in determining the performance of a variety. Soybean seed used for private and public entries in the Kansas Crop Performance Tests is prepared professionally and usually meets or exceeds Kansas Crop Improvement Certification standards. Relative performance of a given variety comparable to that obtained in these tests is best assured under similar environmental conditions and cultural practices and with the use of certified or professionally prepared seed. All companies known to be developing and marketing soybean varieties or brands are invited to submit test seed; interested companies enter on a voluntary, fee-entry basis.

Entries were planted in four-row plots with rows 30 inches apart and were replicated three or four times each. Seeding rate ranged from 7 to 12 seeds per foot of row. The center two rows of each plot were harvested for yield. Harvested row lengths ranged from 11 to 33 feet, depending on location. Cultural practices and rainfall for each test location are presented with each table. Results from this year's tests are presented in Tables 3 through 18. Relative yields of each entry from all locations are shown in Table 19.

DATA INTERPRETATION

Yields are recorded as bushels per acre (60 lb/bushel) adjusted to 13% moisture content, when moisture data are available. Seed yield also is expressed as a percentage of the test average to assist in identifying entries that consistently produce better than the average yield.

Maturity is the date on which 95% of the pods have ripened (browned). Delayed leaf drop and green stems are not considered when assigning maturity. About 1 week of good drying weather after maturing is needed before soybeans are ready to harvest.

Lodging is rated at maturity by the following scores:

1. Almost all plants erect
2. All plants slightly leaning or a few plants down
3. All plants leaning moderately (45%) or 25 to 50% of plants down
4. All plants leaning considerably or 50 to 80% plants down
5. Almost all plants down

Height is the average length from the soil surface to the top of the main stem of mature plants.

VARIETY OR BRAND SELECTION

Performance of soybean varieties or brands varies from year to year and from location to location, depending on factors such as weather, management practices, and variety adaptation. When selecting varieties or brands, producers should carefully analyze variety performance for two or more years across locations. Performance averaged over several environments will provide a better estimate of genetic potential and stability than performance based on a few environments.

Small differences in yield between any two varieties or brands usually are not important. Within maturity groups at each location, a LSD (least significant difference) was calculated. The significance level used to calculate the LSD was 10%. Unless two varieties differ in yield by more than the LSD, genetic yield potential of one entry cannot be considered superior to that of another.

The coefficient of variability (CV) represents an estimate of the precision in the replicated yield trials. A CV of less than 10% indicates a good test with a high level of reliability. CVs ranging from 10 to 15% are usually acceptable for performance comparisons. CVs greater than 15% generally lack sufficient precision to provide any more than a rough guide to cultivar performance. For tests in which the precision was insufficient to statistically compare performance among the entries, the LSD value has been replaced with the designation NS, indicating that seed yields were not significantly different.

Test results also can be found online at: <http://www.agronomy.k-state.edu/services/crop-performance-tests/soybean>

Wabash silty clay

	April	May	June	July	Aug.	Sept.	Total
Rainfall:	1.3	3.3	4.1	4.0	4.5	6.1	29.8

Planting soil conditions were rough and cloddy. Rain from planting through Aug 15 was 3"-5" lower than the 30-year average accumulated precipitation. The field development was set back from Dicamba drift on two separate dates. Insect feeding was present during mid season scouting and warranted insecticide application. September - October brought in above-average precipitation and kept the field from drying, which delayed harvest.

Planted 5/11/2018 at 155,000 seeds/ft; harvested 11/19/2018; 12 ft. by 4-row plot; pesticides: Authority 2.5 oz/ac

Description of traits available in Table 20.

East Central Kansas Experiment Field, Ottawa, Franklin County: Eric Adee, agronomist; Jim Kimball, technician

Woodson silt loam

June and July were extremely dry, however the temperatures were not extremely hot throughout most of the season. The beans virtually shut down from lack of moisture stress a couple of times throughout the growing season. Conditions were very wet during pod fill and maturity, lowering seed quality and delaying harvest.

Rainfall:	April	May	June	July	Aug.	Sept.	Total
	1.4	3.2	1.6	1.6	4.9	3.3	27.6

Planted 5/16/2018 at 140,000 seeds/ft; harvested 10/29/2018; 26 ft. by 4-row plot; pesticides: 3.5 oz/ac Zidua, 7 oz/ac Authority XL, 1.5 Dual Magnum, 12 oz/ac Select Max, First Rate .6 oz/ac

Southeast Agricultural Research Center, Parsons, Labette County; Lonnie Mengarelli, research technician

Parsons Silt Loam

Planting and emergence was good. The weather turned hot and very dry for 2 middle weeks of July and then again for the first half of August. The last 3 weeks of September were also very dry and on October 4 it turned cool and very wet and had a hard time drying out enough to dry down plants to harvest.

	April	May	June	July	Aug.	Sept.	Total
Rainfall:	1.3	7.6	2.4	3.4	8.8	3.4	31.8

Planted 6/8/2018 at 100,000 seeds/ft; harvested 11/29/2018; 14 ft. by 4-row plot; pesticides: 2 pt/ac Gramoxone, 2 pt/ac Dual II Magnum, 1.5 lb/ac metribuzin, 6 oz/ac Authority XL

Description of traits available in Table 20.

Vernon Egbert Farm, McCune, Crawford County; Bill Schapaugh, agronomist

	April	May	June	July	Aug.	Sept.	Total
Rainfall:	1.6	3.9	1.1	3.9	8.9	1.8	21.1

Planting soil conditions were favorable, with good emergence. Accumulated precipitation from planting through Aug 17 was 2.25" to 5" below the 30-year average. Mid season to harvest field received above-average precipitation. Insect feeding was present and warranted an insecticide application. November cool temperatures and snow events delayed harvest.

Planted 6/6/2018 at 100,000 seeds/ft; harvested 11/29/2018; 12 ft. by 4-row plot; pesticides: Authority 5 oz/ac

Description of traits available in Table 20.

Joe Harris Farm, Erie, Neosho County; Gretchen Sassenrath, agronomist; Lonnie Mengarelli, research technician

Lanton Silt Loam

	April	May	June	July	Aug.	Sept.	Total
Rainfall:	1.1	6.2	1.9	3.9	6.9	2.6	28.3

Planting went very well and emergence was good. The weather turned hot and very dry for 2 middle weeks of July and then again for the first half of August. The last 3 weeks of September were also very dry and on October 4th it turned cool and very wet and had a hard time drying out enough to dry down plants and mud enough to harvest.

Planted 6/8/2018 at 100,000 seeds/ft; harvested 12/10/2018; 10 ft. by 4-row plot; pesticides: 2 pt/ac Gramoxone, 2 pt/ac Dual II Magnum, 1.5 lb/ac metribuzin, 6 oz/ac Athory XL

Description of traits available in Table 20.

Dale Roberds Farm, Pittsburg, Cherokee County; Bill Schapaugh, agronomist

Parsons Silt Loam

Double crop soil conditions at planting were firm but good moisture available near 2". Achieved excellent emergence and stands.

Rainfall:	April	May	June	July	Aug.	Sept.	Total
	1.6	3.9	1.1	3.9	8.9	1.8	21.1

Accumulated precipitation from planting through harvest was just below the 30-year average. No precipitation occurred from July 18 - Aug 18. Insect feeding was present during pod development and resulted in insecticide application. November cool temperatures and snow events delayed harvest.

Planted 6/18/2018 at 155,000 seeds/ft; harvested 11/16/2018; 24 ft. by 4-row plot; pesticides: 1 qt/ac gramoxone, 5 oz/ac Trivence

Description of traits available in Table 20.

Clayton Short Farm, Assaria, Saline County; Bill Schapaugh, agronomist

Ladysmith silty clay loam

	April	May	June	July	Aug.	Sept.	Total
Rainfall:	1.2	2.1	6.2	3.1	4.6	5.4	28.3

Planting soil conditions were moderately cloudy but with good moisture. Accumulated precipitation from planting until October were marginally lower than the 30-year average. Dry conditions through June into July. October 4th to harvest precipitation was notably above the 30-year average. The field development was set back from Dicamba drift mid season. October weather kept field from drying, which delayed harvest.

Planted 5/24/2018 at 155,000 seeds/ft; harvested 11/1/2018; 12 ft. by 4-row plot; pesticides: 3.3 oz/ac Zidua, 4 oz/ac Authority

Excerpts from the University Research Policy Agreement with Cooperating Seed Companies

Permission is hereby given to Kansas State University (KSU) to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 1146, '2018 Kansas Performance Tests with Soybean Varieties,' or the Kansas Crop Performance Test website, www.agronomy.k-state.edu/services/crop-performance-tests/index.html, for details."
