2001 KANSAS CORN PERFORMANCE TESTS

TEST OBJECTIVES AND PROCEDURES

Corn Performance Tests, conducted annually by the Kansas Agricultural Experiment Station, provide farmers, extension workers, and private research and sales personnel with unbiased agronomic information on many of the corn hybrids marketed in the state. Entry fees from private seed companies help finance the tests. Seed companies receive test announcements and entry forms in late January each year; deadlines for receipt of completed entry forms and seed are in early March. Because entry selection and location are voluntary, not all hybrids grown in the state are included in tests, and the same group of hybrids is not grown uniformly at all test locations.

Short-season corn performance tests target hybrids for early-planted, short-season, cropping systems. Hybrids with adequate heat and drought tolerance are needed for these systems. These hybrids often will be subjected to severe heat and drought stress in July and August. These systems typically are utilized on soils with poor water-holding capacities. Early-maturing hybrids often are able to escape a good portion of the typical stress, if they can be planted early.

A summary of growing-season weather data is given in individual test discussions. These data are from the nearest weather-reporting station and often are supplemented with information from the test site. Precipitation graphs include cumulative lines for 2001 and the 30-year normal in addition to the daily rainfall amounts since last fall. Temperature graphs include daily maximum and minimum temperatures compared with normal. Growing degree graphs include cumulative lines for 2001 and normal. All graphs include vertical lines indicating planting, silking, and harvest dates, if available. General trends in precipitation and temperature relative to normal are readily observed in the graphs. For more detailed information, a table is included with monthly totals and averages for the growing season.

CORN BORER status of a representative susceptible hybrid is listed with the other

descriptive information preceding each table for several locations. The listed infestation rates and tunnel lengths may not represent the actual extent of damage if the sampling date precedes harvest by several weeks, but they do provide an indication of the level of corn borer infestation at a given location. Early harvest and limited resources prevented sampling at many locations.

Explanatory information is given preceding data summaries for each test. Tables 1-26 contain results from the individual performance tests. Hybrids are listed in order of increasing days to half silk and increasing grain moisture for the current year, so hybrids of similar maturity appear together. Yield summaries following each group of tests (Tables 4, 8, 13, 18, 24, 27) present yield as a percent of the average for each location and averaged over all locations in that region. The 2001 entrants and entries are listed in the Appendixes.

Figures 5-10 graphically summarize yield and maturity information over the past 3 years for each region. In these figures, hybrid performance is standardized using the average of two check hybrids present in every test (Pioneer 3162 and Golden Harvest H2530). The number beside each bar shows the number of tests where a given hybrid was compared with the check hybrids. In general, the greater the number of comparisons, the greater confidence one can place in the stated performance of that hybrid. Symbols beside each bar indicate if a hybrid was significantly greater (+), lower (-), or not different (no symbol) than the average of the check hybrids. As with individual test results, small differences should not be overemphasized. Relative ranking and large differences are better indicators of hybrid performance.

Most corn tests were planted at a rate 10% to 20% above the desired population and thinned only to remove doubles. Planting to stand enables evaluation of product performance for the entire growing season.

Tractor-powered, modified, White air-planters were used for nearly all tests. Four plots

(replications) of each hybrid were grown at each location in a randomized complete block design. Four-row plots were used in the west no-till tests. Each harvested plot consisted of two rows trimmed to a specific length ranging from 20 to 30 feet at the different locations. Tests were harvested with specialized plot combines equipped with automatic weighing and sampling devices.

GRAIN YIELDS are reported as bushels per acre of shelled grain (56 lbs/bu) adjusted to a moisture content of 15.5%. *BUSHEL YIELDS* are given but also are converted to *YIELDS AS PERCENTAGES OF THE TEST AVERAGE* to speed recognition of highest-yielding hybrids (more than 100%, the test average). The actual test average in bushels per acre is listed as the test average in the *YIELD AS % OF TEST AVERAGE* columns as a guide to actual yields. Hybrids yielding more than 100% of the test average year after year merit consideration, but adaptation to individual farms for appropriate maturity, stalk strength, and other factors also must be considered.

The number of *LODGED EARS* is reported, when appropriate. Plants broken over below the ear and dropped ears were considered *LODGED*, although many were harvestable with modern machinery. Severely lodged stalks or dropped ears that could not be picked up by normal harvest procedures were not included in yield. Because harvest often is delayed until latest maturing entries are ripe, early and mid-season hybrids could lose ears simply because they must wait well past their optimum harvest date. In most years at most locations, dropped ears constitute a very small portion of lodging and do not significantly affect yields.

Relative maturity is measured in terms of both *NUMBER OF DAYS FROM PLANTING TO SILKING* and *GRAIN MOISTURE AT HARVEST* at most locations. Entries are listed in order of increasing maturity based on days to silking and harvest moisture in the current year to facilitate comparison of hybrids of like maturity. Maturity can be critical when considering a corn hybrid for a specific cropping system.

The *GROWTH UNIT* or *GROWING DEGREE DAY* concept was developed to measure the

amount of heat available for growth and maturation. The formula used to generate the monthly totals in individual test discussions follows. Take the maximum temperature plus the minimum temperature for each day, divide by 2, and then subtract a base temperature of 50 each day. Any temperature below 50°F was considered to be 50, and any temperature over 86°F was called 86. Growth unit accumulations for the current year are compared with the long-term average or 'normal' for each test.

Small differences in yield or other characteristics should not be overemphasized. Least significant differences (LSD's) are shown at the bottom of each table. Unless two entries differ by at least the LSD shown, little confidence can be placed in one being superior to the other. The coefficient of variability (CV) can be used to estimate the degree of confidence one can have in published data from replicated tests. In this testing program, CV's below 10% generally indicate reliable, uniform data, whereas CV's of 10 to 15% are not uncommon and usually indicate that data are acceptable for the rough performance comparisons desired from these tests. Tests with CV's over 15% still may be useful, but hybrid comparisons lack precision.

2001 STATEWIDE GROWING CONDITIONS

Figures 1 and 2 illustrate the temperature and soil moisture trends during 2001. Figure 3 shows how the condition of the crop changed in response to the weather. Figure 4 illustrates how crop development was affected by the growing conditions and how it compared to previous years.

Relatively cool, wet conditions early in the growing season delayed planting in some areas. However, planting finished up nearly a week ahead of average statewide. Favorable conditions through early June resulted in 80% of the crop being classified in good or excellent condition in late June and early July. However, temperatures regularly exceeded 100°F and rainfall decreased beginning in mid-June. As a result, the condition of the crop dropped dramatically during the first half of July. By mid-July, less than 60% of the crop was classified as good or excellent. The trend continued at a slower pace through August, so that only 50% of the crop fell in those two categories at harvest.

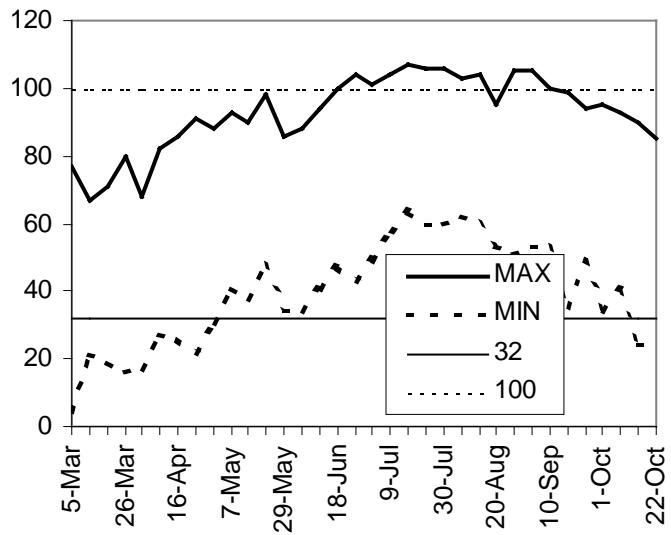

Figure 1. 2001 Kansas weekly maximum and minimum temperatures.

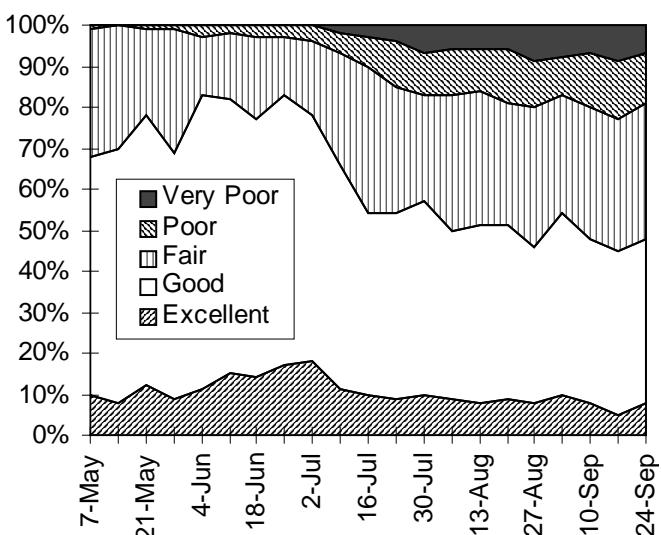

Figure 3. Condition of 2001 Kansas corn crop.

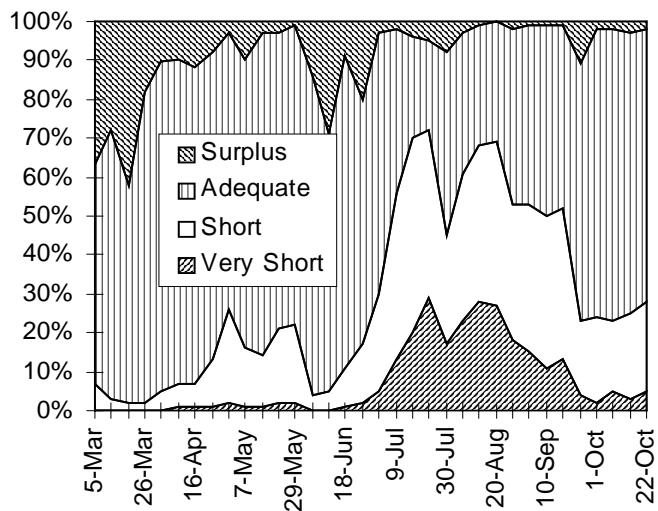

Figure 2. Statewide status of topsoil moisture.

Although planting lagged behind, silking tracked fairly closely with last year's. High temperatures during silking and early grain fill maintained rapid crop development. A significant portion of the crop reached the dent stage ahead of even last year. Beginning in late July, a significant amount of dryland corn was chopped for silage because drought conditions had severely limited grain yield. However, moderating temperatures and significant rainfall slowed maturation of irrigated and well-watered acreage in late August. As a result, harvest progress followed the long-term average more closely than last year. The longer grain-filling period resulted in excellent yields in well-watered and irrigated areas.

(From Crop-Weather reports, Kansas Agricultural Statistics, Topeka).

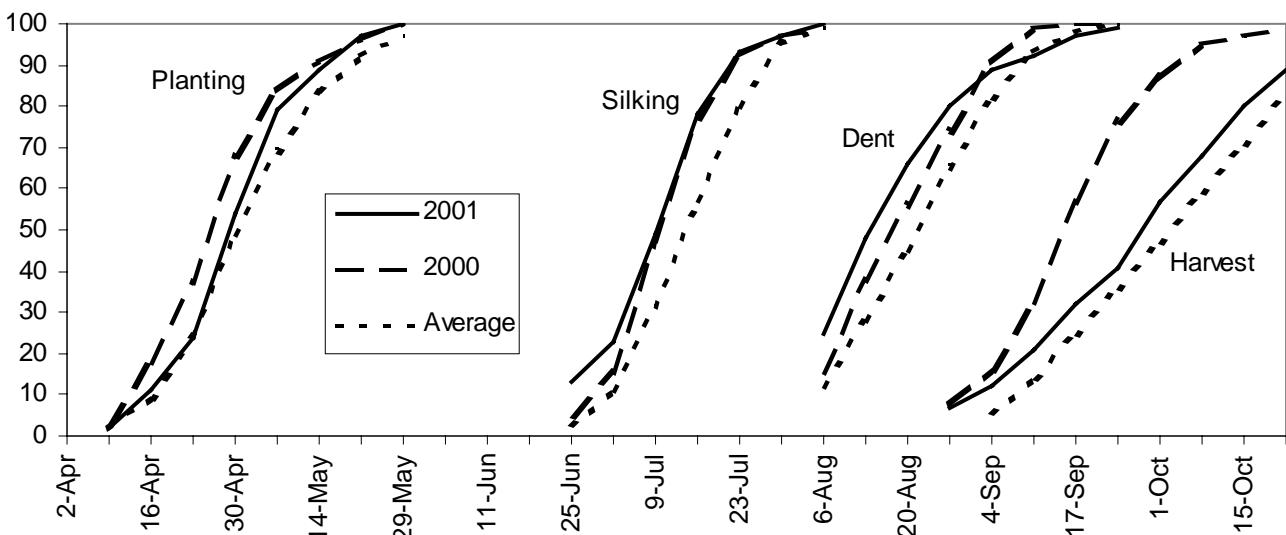

Figure 4. Progress of 2001 Kansas corn crop.

As usual, insect pests attempted to eat a share of the corn crop. Southern corn leaf beetles were especially numerous in Lyon County in late April. Lighter populations of this pest were noted in several areas. Cool, wet weather slowed corn growth, making it more susceptible to damage from flea beetles, cutworms, and wireworms. An unusual pest of seedling corn this year was the beet armyworm. Populations of the larval form of this insect found in fields south of Garden City in May varied from light to 80% infestation.

European and southwestern corn borers were active again in 2001, but didn't appear to cause as much damage as last year. Spider mite populations did not develop as rapidly as expected, considering the favorable conditions in July and August.

(From Kansas Insect Newsletter, Extension Entomology, Kansas State University; Kansas Cooperative Economic Insect Survey Reports, Kansas Department of Agriculture; and Southwest Kansas Entomology Update, Southwest Research-Extension Center.)

Wet conditions during planting caused some early-season problems. Sidewall compaction occasionally was a problem in heavy soils. Seedling blights caused by several different organisms occurred on young corn in areas subjected to excess early-season rainfall.

Gray leaf spot traditionally has been a problem in south central and southeast Kansas. In early July 40-50% of south central corn fields had light or moderate levels of gray leaf spot. Many of these fields were above treatment threshold levels. The remaining fields in south central Kansas were either gray leaf spot free or had it at very low levels. Gray leaf spot was not a widespread problem in northeast Kansas this year.

Drought conditions in many parts of Kansas provided the opportunity for the ear rot fungus *Aspergillus flavus* to establish itself on corn ears. Besides the direct loss due to damaged kernels, *A. flavus* is also capable of producing aflatoxin, a potent carcinogen. The presence of *Aspergillus* was not necessarily related to the production of aflatoxin, and little, if any, aflatoxin was detected at harvest time. Other ear molds were present in areas where moisture was excessive during the dry down period.

During mid-August, corn samples began to arrive

at the Plant Pathology Diagnostic Lab exhibiting symptoms of stalk rot. Fusarium stalk rot and charcoal rot were responsible for most of the problems, although some anthracnose stalk rot occurred in northeast Kansas where rain was more plentiful this summer. Often the plants suffered from premature dying. This early shut down of the plant resulted in smaller, lighter test weight ears and reduced yields. Average yield reductions generally ranged from 5-15 percent, but yield reductions of over 50 percent were reported in individual fields. Later in the season, lodging associated with stalk rot was reported. In many cases, the lodging occurred in the same areas where rootless corn syndrome was a problem early in the season. The lack of brace root development caused the corn to lodge as it matured.

Other diseases observed in corn samples submitted to the Plant Pathology Diagnostic Lab included maize dwarf mosaic virus, Johnsongrass mosaic virus, sugarcane mosaic virus, lesion nematode, and stubby root nematode.

(From Doug Jardine in *Disease Alerts*, Kansas State University Department of Plant Pathology.)

The October 12 Crops Report predicted a 409 million bushel crop, down 2% from last year's crop. This production is from 3.1 million harvested acres, down 3% from last year. The predicted average yield of 132 bushels per acre is 2 bushels above the final estimate for 2000.

(From Kansas Agricultural Statistics.)

GRAIN QUALITY SUMMARY

Relative protein, oil, and starch contents for many hybrids are presented in Appendix 3. Two hybrids that were present in every test were used as checks: Pioneer 3162 and Golden Harvest H-2530. Hybrids are included if they were included in the same tests with the checks at least 5 times. At every location, each hybrid was compared to the average of these two check hybrids. These differences were averaged over the total number of tests where the comparisons were made and were used to calculate standardized values. The corn hybrids displayed rather narrow ranges for the various quality parameters (protein 1.7%, oil 0.8%, starch 2.0%). However, the differences, especially for protein, were large enough to have a potential economic impact for livestock feeders.

2001 GROWING CONDITIONS:

The test was planted into a rough seedbed, but early conditions appeared favorable. Cutworms and heavy rains may have been the cause of reduced stands in many plots. Good rains were separated by extended dry periods, causing some level of stress to the crop. Rust moved in late in the season, shortening the grainfill period and likely lowering yields.

NORTHEASTERN KANSAS STANDARD CORN TEST ON SILTY CLAY LOAM SOIL

COUNTY: BROWN

LOCATION: Private farm north of Powhatan

TEST SITE: Grundy silty clay loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 110 N 0 P₂O₅ 0 K₂O

PLANTING DATE: 4/18/01

HARVEST DATE: 10/4/01

COOPERATORS: Larry Maddux, agronomist; Charles Clark and William Riley, technicians

TARGET POPULATION: 23,000 plants/acre, 9.1 in. spacing

FINAL STAND (% of target): 99

SILK DATES: 6/30/01 - 7/10/01

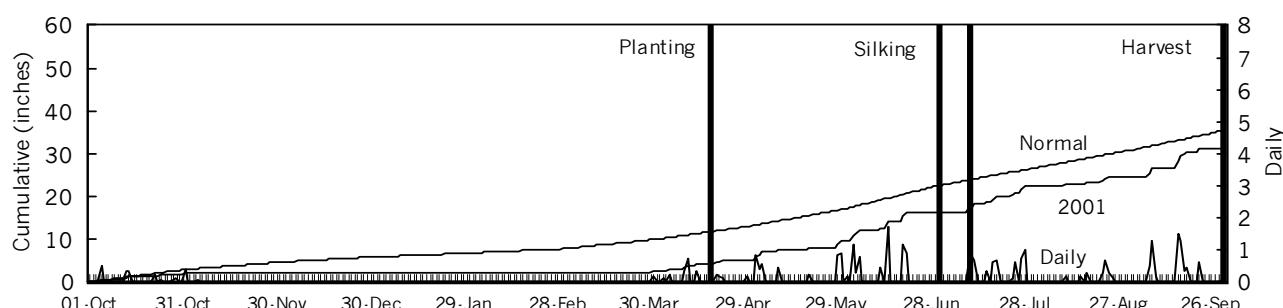

YIELD: Avg. (bu/a): 180 Range (bu/a): 144 - 215
LSD (bu/a): 16 CV (%): 6

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

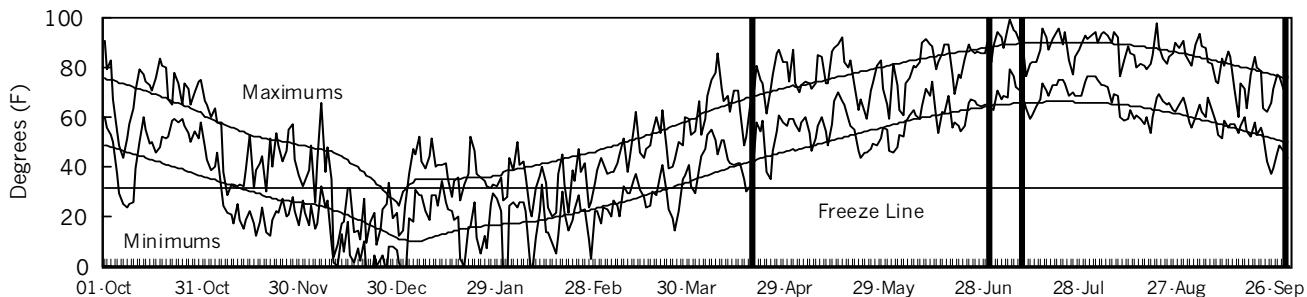

2001 GROWING CONDITIONS:

The test was planted no-till into soybean stubble. Good stands were obtained for most entries. Favorable rains all during the growing season and little disease or insect pressure facilitated outstanding yields. Some lodging occurred, but the combine could pick up most stalks.

NORTHEASTERN KANSAS STANDARD CORN TEST ON SILT LOAM SOIL

COUNTY: RILEY

LOCATION: Agronomy North Farm near Manhattan

TEST SITE: Reading silt loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 130 N 0 P₂O₅ 0 K₂O

PLANTING DATE: 4/17/01

HARVEST DATE: 9/11/01

COOPERATORS: Kraig Roozeboom, agronomist; Karl Mannschreck, superintendent

TARGET POPULATION: 23,000 plants/acre, 9.1 in. spacing

FINAL STAND (% of target): 91

SILK DATES: 6/27/01 - 7/5/01

YIELD: Avg. (bu/a): 96 Range (bu/a): 67 - 134

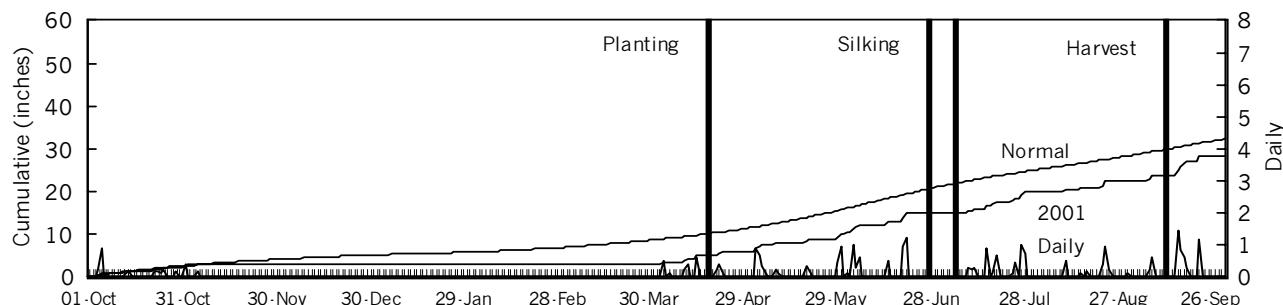

LSD (bu/a): 15 CV (%): 10

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

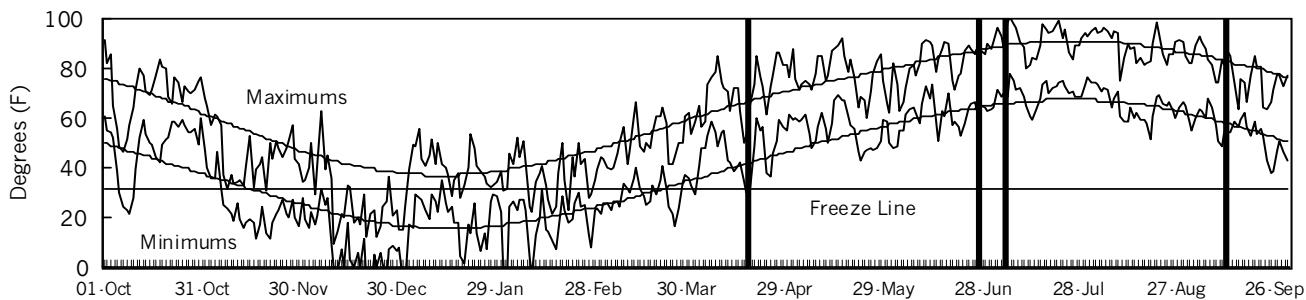

2001 GROWING CONDITIONS:

A good seedbed enabled the establishment of generally acceptable stands. Dry conditions in the summer and fall of 2000 enabled the soybean herbicide to carry over and cause damage to several entries. Yields appear to have been somewhat related to response to herbicide damage, but not entirely. A hail storm on June 16 shredded the leaves and may have lowered potential yields. Stalk rots appear to have shut down grain fill prematurely in late August.

Values beside bars indicate the number of comparisons with checks. Symbols (+,-) indicate if statistically higher or lower than mean of checks.

EAST CENTRAL KANSAS STANDARD CORN TEST ON SILT LOAM SOIL, IRRIGATED

COUNTY: SHAWNEE

LOCATION: Kansas River Valley Experiment Field, Silver Lake

TEST SITE: Eudora silt loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 160 N 35 P₂O₅ 0 K₂O

PLANTING DATE: 4/30/01

HARVEST DATE: 10/1/01

COOPERATORS: Larry Maddux, agronomist; Charles Clark and William Riley, technicians

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 112

SILK DATES: 7/1/01 - 7/8/01

YIELD: Avg. (bu/a): 186 Range (bu/a): 142 - 224

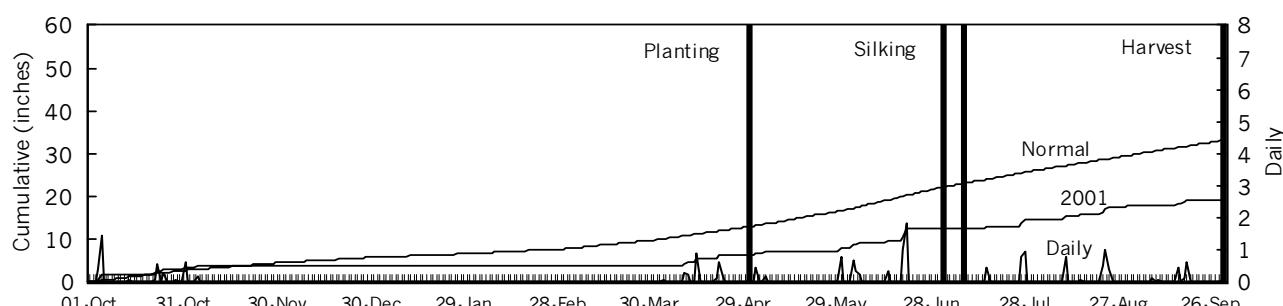

LSD (bu/a): 22 CV (%): 7

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susc. hybrid)	--	--	--	--

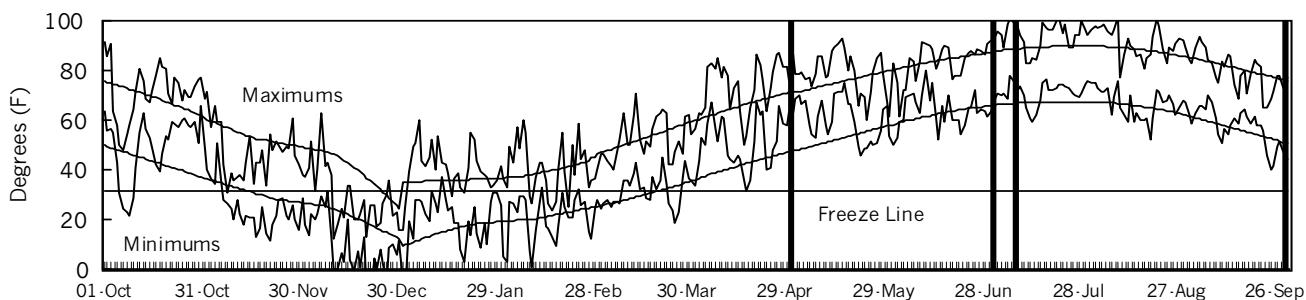

2001 GROWING CONDITIONS:

Good stands were obtained for all entries. Generally favorable growing conditions resulted in outstanding yields.

NORTHEAST KANSAS STANDARD CORN TEST ON SILT LOAM SOIL, IRRIGATED

COUNTY: CLAY

LOCATION: Mark Taddiken farm near Clifton

TEST SITE: Muir silt loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 200 N 15 P₂O₅ 0 K₂O

PLANTING DATE: 4/20/01

HARVEST DATE: 10/12/01

COOPERATORS: Mark Taddiken; Taddiken Farm, Inc.

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 100

SILK DATES: 6/30/01 - 7/8/01

YIELD: Avg. (bu/a): 223 Range (bu/a): 159 - 265

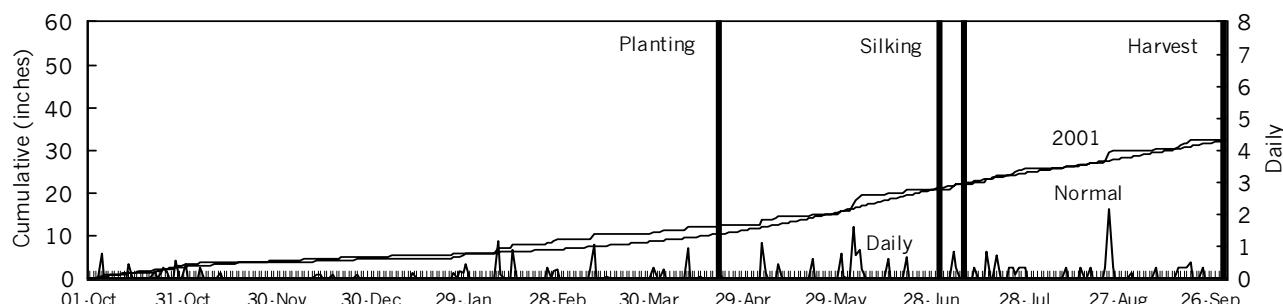

LSD (bu/a): 17 CV (%): 6

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

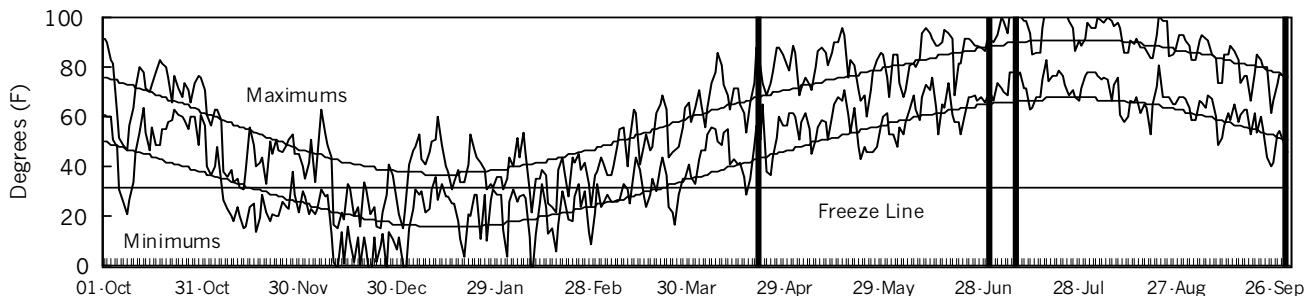

2001 GROWING CONDITIONS:

The test was no-till planted into soybean stubble under excellent conditions. Insecticide applications controlled early-season pests. Favorable conditions prevailed during most of the growing season resulting in excellent yields.

NORTH CENTRAL KANSAS STANDARD CORN TEST, IRRIGATED

COUNTY: REPUBLIC

LOCATION: Irrigation Experiment Field, Scandia

TEST SITE: Crete silt loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 220 N 30 P₂O₅ 0 K₂O

PLANTING DATE: 4/24/01

HARVEST DATE: 10/18/01

COOPERATORS: Barney Gordon, agronomist; Michael Larson and Allan Milner, technicians

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 122

SILK DATES: 7/8/01 - 7/14/01

YIELD: Avg. (bu/a): 198 Range (bu/a): 171 - 218

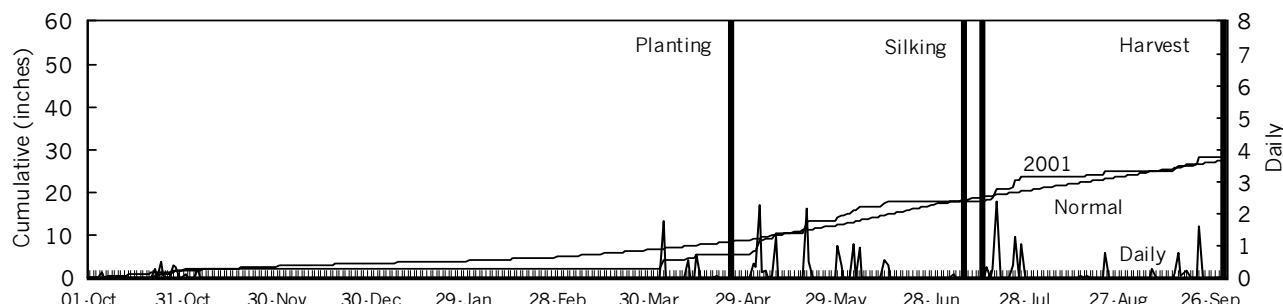

LSD (bu/a): 8 CV (%): 3

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

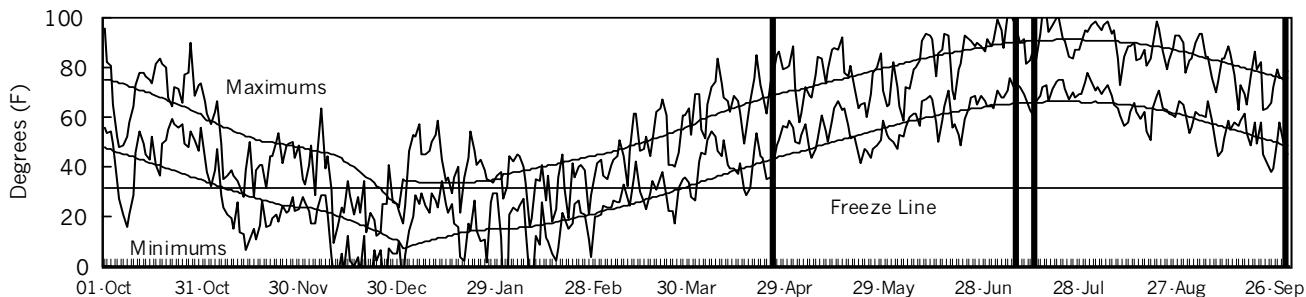

2001 GROWING CONDITIONS:

All plots had good stands. May and early June were cool and wet. Early season rains provided good moisture availability until irrigations later in the season. Favorable grain filling conditions resulted in excellent yields.

Values beside bars indicate the number of comparisons with checks. Symbols (+,-) indicate if statistically higher or lower than mean of checks.

EAST CENTRAL KANSAS STANDARD CORN TEST ON SILTY CLAY LOAM

COUNTY: SHAWNEE

LOCATION: Erma Harden farm northwest of Topeka

TEST SITE: Silt loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 140 N 35 P₂O₅ 0 K₂O

PLANTING DATE: 4/20/01

HARVEST DATE: 10/2/01

COOPERATORS: Larry Maddux, agronomist; Charles Clark and William Riley, technicians

TARGET POPULATION: 22,000 plants/acre, 9.5 in. spacing

FINAL STAND (% of target): 94

SILK DATES: 6/26/01 - 7/2/01

YIELD: Avg. (bu/a): 134 Range (bu/a): 98 - 187

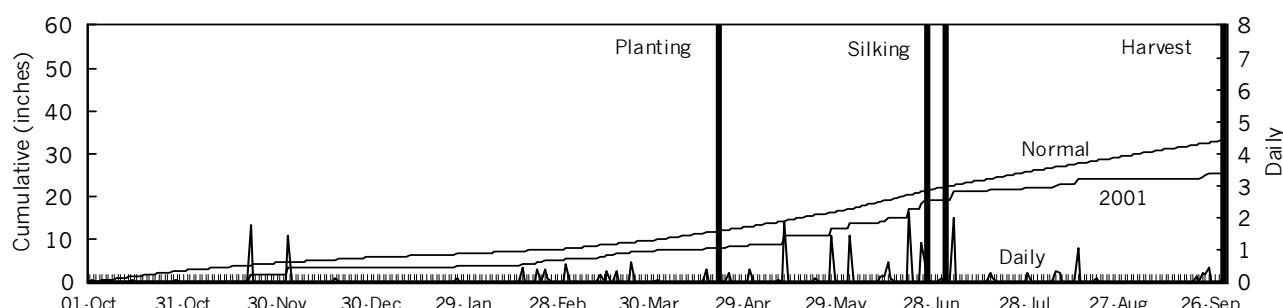

LSD (bu/a): 18 CV (%): 10

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

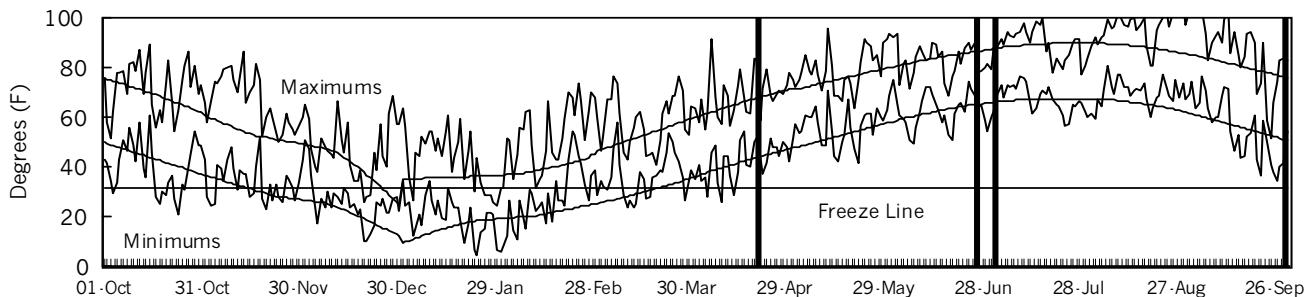

2001 GROWING CONDITIONS:

Stands were more variable than desired. Some of the lowest yielding hybrids had the poorest stands, although not exclusively. Rainfall was below normal in July, August, and September. Top yields were quite impressive for dryland corn in this area. Lodging was minimal and nonsignificant.

EAST CENTRAL KANSAS STANDARD CORN TEST ON UPLAND SILT LOAM SOIL

COUNTY: FRANKLIN

LOCATION: East Central Kansas Experiment Field, Ottawa

TEST SITE: Woodson silt loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 111 N 38 P₂O₅ 0 K₂O

PLANTING DATE: 4/24/01

HARVEST DATE: 9/13/01

COOPERATORS: Keith Janssen, agronomist; Jim Kimball, technician

TARGET POPULATION: 21,000 plants/acre, 10.0 in. spacing

FINAL STAND (% of target): 103

SILK DATES: 6/28/01 - 7/5/01

YIELD: Avg. (bu/a): 106 Range (bu/a): 85 - 126

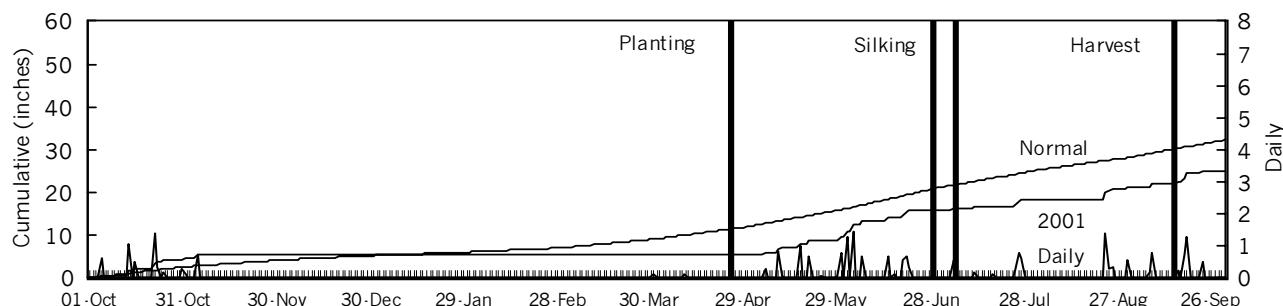

LSD (bu/a): 15 CV (%): 10

CORN BORERS: (susc. hybrid)	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		

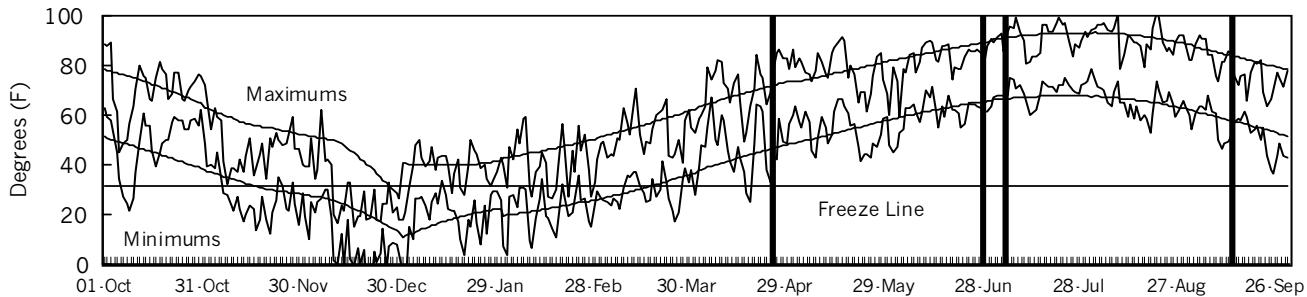

2001 GROWING CONDITIONS:

The test was planted into an excellent seedbed, resulting in good stands for all entries. Spring and early summer conditions were favorable. However, hot, dry conditions in July and August inhibited grain fill and hastened maturity and dry down. Some lodging occurred, but no hybrid differences were detected.

SOUTHEASTERN KANSAS STANDARD CORN TEST ON RIVER-BOTTOM SOIL

COUNTY: NEOSHO

LOCATION: Private farm south of Erie

TEST SITE: Lanton silt loam

2000 CROP: Soybean

1999 CROP: Soybean

FERTILIZER (lbs/acre): 150 N 30 P₂O₅ 30 K₂O

PLANTING DATE: 4/9/01

HARVEST DATE: 8/28/01

COOPERATORS: James Long, agronomist; Kelly Kusel, research technician

TARGET POPULATION: 25,000 plants/acre, 8.4 in. spacing

FINAL STAND (% of target): 115

SILK DATES: 6/17/01 - 6/22/01

YIELD: Avg. (bu/a): 201 Range (bu/a): 162 - 226

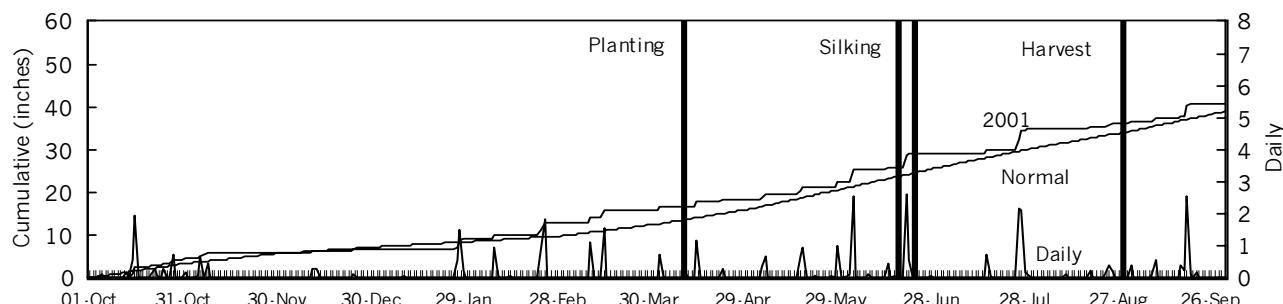

LSD (bu/a): 19 CV (%): 7

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	65	0	3	8/16/01

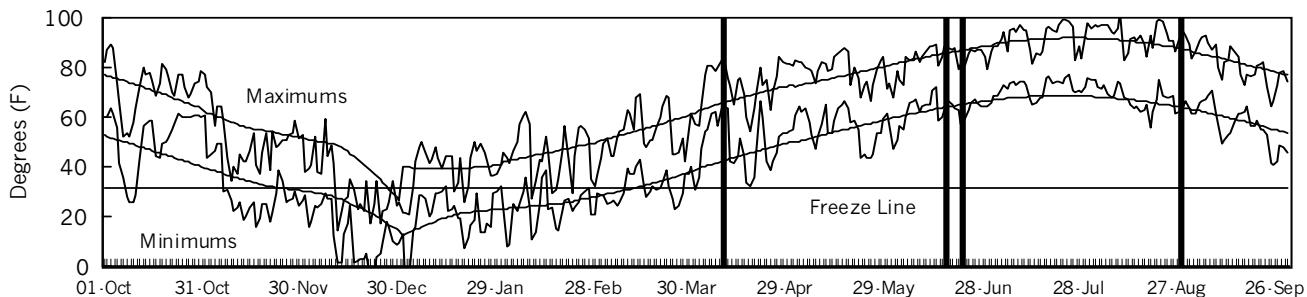

2001 GROWING CONDITIONS:

Excellent establishment conditions resulted in good stands. Favorable conditions continued through most of the growing season. Small numbers of corn earworm were noted late in the season. Disease pressure was minimal.

SOUTH CENTRAL KANSAS CORN TEST, MIN-TILL DRYLAND

COUNTY: HARVEY

LOCATION: Harvey County Experiment Field, Hesston

TEST SITE: Smolan silt loam

2000 CROP: Wheat

1999 CROP: Corn

FERTILIZER (lbs/acre): 125 N 37 P₂O₅ 0 K₂O

PLANTING DATE: 4/19/01

HARVEST DATE: 8/28/01

COOPERATORS: Mark Claassen, agronomist; Lowell Stucky and Kevin Duerksen, technicians

TARGET POPULATION: 20,000 plants/acre, 10.5 in. spacing

FINAL STAND (% of target): 97

SILK DATES: 6/24/01 - 7/3/01

YIELD: Avg. (bu/a): 30 Range (bu/a): 10 - 57

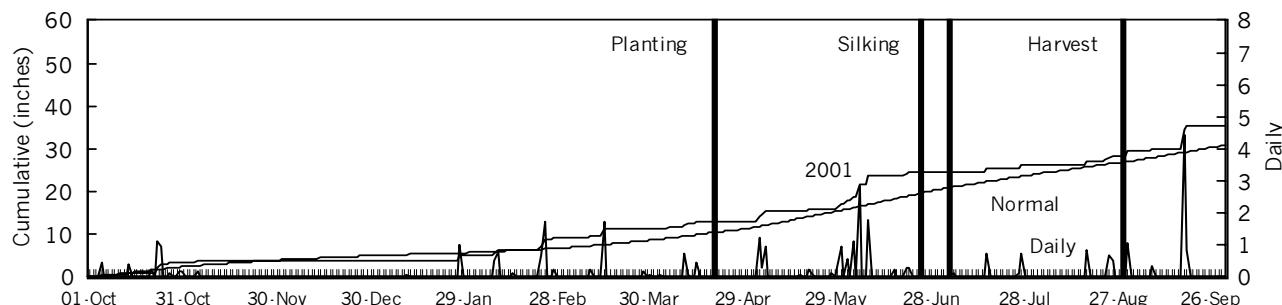

LSD (bu/a): 6 CV (%): 15

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

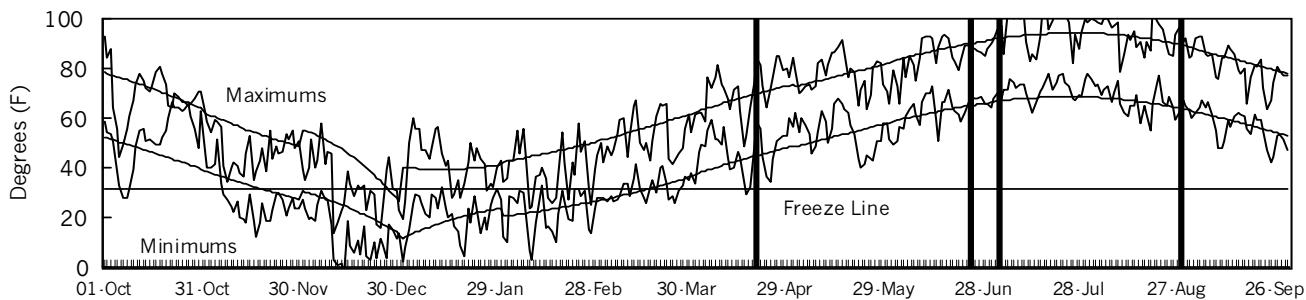

2001 GROWING CONDITIONS:

Corn was planted into a moist seedbed and emerged at the end of April. Temperatures were above average in April, normal in May, and below average in June. Precipitation was below normal during April-May, but well above average in June. Temperatures were above normal in July and August. During this time, temperatures equaled or exceeded 100 F on 19 days. Rainfall was below normal, and corn suffered severe drought stress beginning in early July, just after most hybrids had completed silking.

SOUTH CENTRAL KANSAS CORN TEST, MIN-TILL DRYLAND

COUNTY: STAFFORD

LOCATION: Sandyland Experiment Field, St. John

TEST SITE: Naron loamy fine sand

2000 CROP: Soybean

1999 CROP: Wheat

FERTILIZER (lbs/acre): 143 N 46 P₂O₅ 0 K₂O

PLANTING DATE: 4/15/01

HARVEST DATE: 9/26/01

COOPERATORS: Victor Martin, agronomist; Ron Cunningham and Jeff Scott, technicians

TARGET POPULATION: 18,000 plants/acre, 11.6 in. spacing

FINAL STAND (% of target): 110

SILK DATES: 6/30/01 - 7/12/01

YIELD: Avg. (bu/a): 68 Range (bu/a): 52 - 86

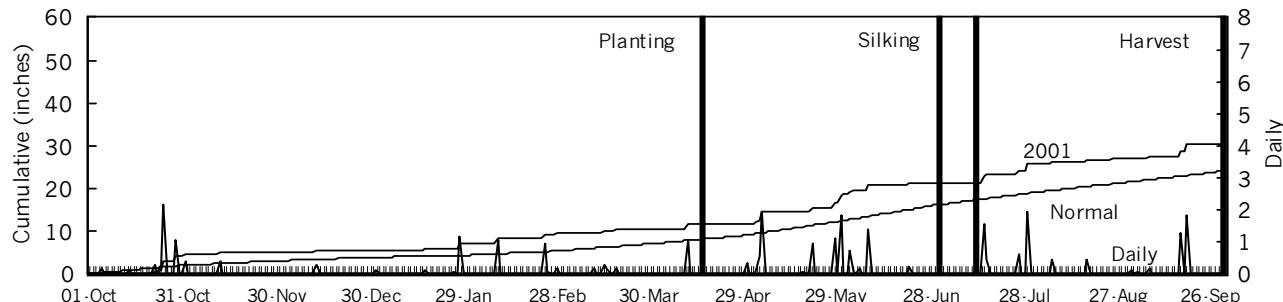

LSD (bu/a): 14 CV (%): 14

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

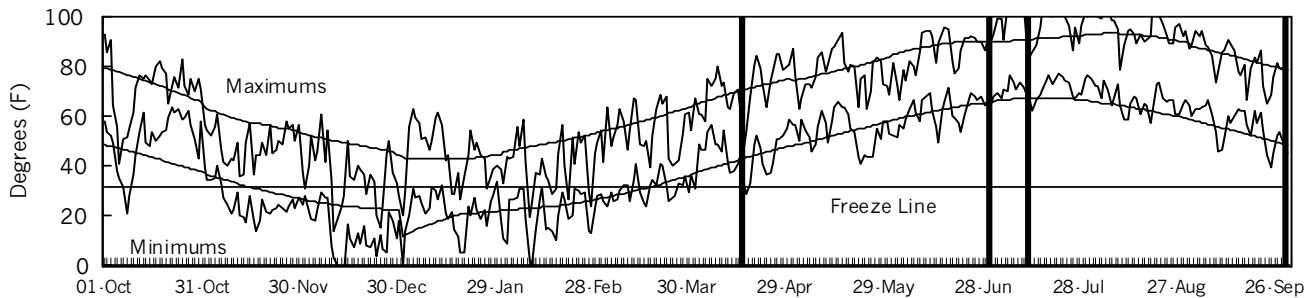

2001 GROWING CONDITIONS:

The test was planted into good moisture, but a wide range of weather conditions during the rest of the season increased yield variability. A 7" rain in May flooded some plots. Two hail storms hit the test in May. Cool, wet conditions in May and early June were followed by heat and moisture stress later in the season. Conditions were especially hot and dry during pollination. Several individual plots were lost, but the rest of the test provided sufficient information to estimate hybrid average yield.

NORTH CENTRAL KANSAS STANDARD CORN TEST, NO-TILL DRYLAND

COUNTY: ELLIS

LOCATION: KSU Agricultural Research Center - Hays

TEST SITE: Harney clay loam

2000 CROP: Soybean

1999 CROP: Sorghum

FERTILIZER (lbs/acre): 65 N 0 P₂O₅ 0 K₂O

PLANTING DATE: 4/24/01

HARVEST DATE: 10/1/01

COOPERATORS: Ken Kofoid, agronomist

TARGET POPULATION: 17,000 plants/acre, 12.3 in. spacing

FINAL STAND (% of target): 97

SILK DATES: 7/10/01 - 7/20/01

YIELD: Avg. (bu/a): 42 Range (bu/a): 19 - 64

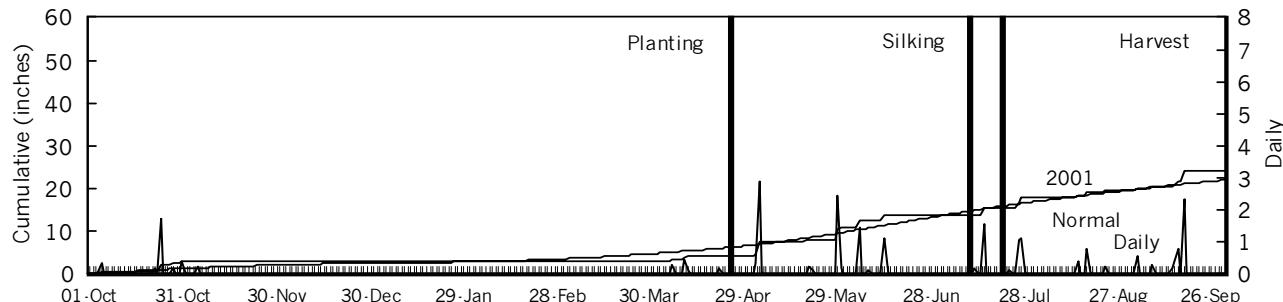

LSD (bu/a): 10 CV (%): 11

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	0	8	0.4	9/12/01

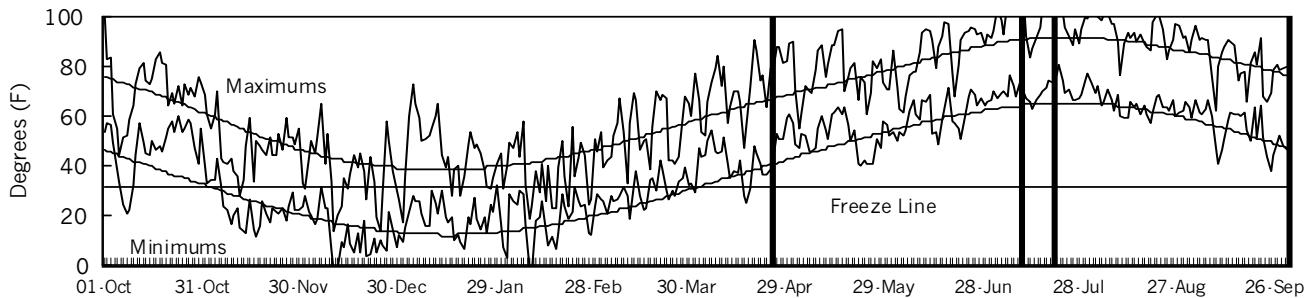

2001 GROWING CONDITIONS:

Stands were extremely good with nearly 100% emergence. Favorable conditions immediately after planting enabled the plants to get off to a good start. Excessive rainfall in late May caused standing water with the soil profile at or near field capacity for 3 weeks. Extremely hot, dry conditions during early July caused severe heat stress. Silking was delayed and pollen shed was reduced resulting in poorly pollinated ears. The pollination problems and heat stress decreased yield potential and increased variability.

NORTHWESTERN KANSAS STANDARD CORN TEST, NO-TILL DRYLAND

COUNTY: THOMAS

LOCATION: Northwest Research-Extension Center, Colby

TEST SITE: Keith silt loam

2000 CROP: Wheat

1999 CROP: Fallow

FERTILIZER (lbs/acre): 140 N 0 P₂O₅ 0 K₂O

PLANTING DATE: 4/27/01

HARVEST DATE: 10/1/01

COOPERATORS: Patrick Evans, agronomist

TARGET POPULATION: 17,000 plants/acre, 12.3 in. spacing

FINAL STAND (% of target): 98

SILK DATES: 7/11/01 - 7/25/01

YIELD: Avg. (bu/a): 67 Range (bu/a): 33 - 92

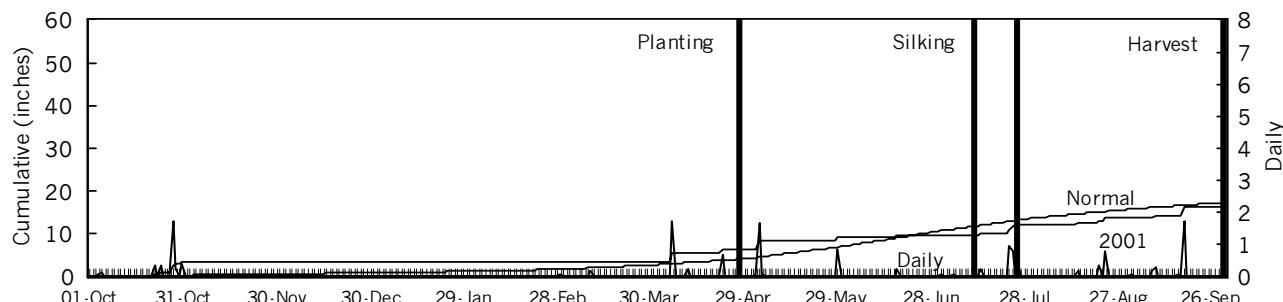

LSD (bu/a): 18 CV (%): 13

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	20	0	0.2	9/12/01

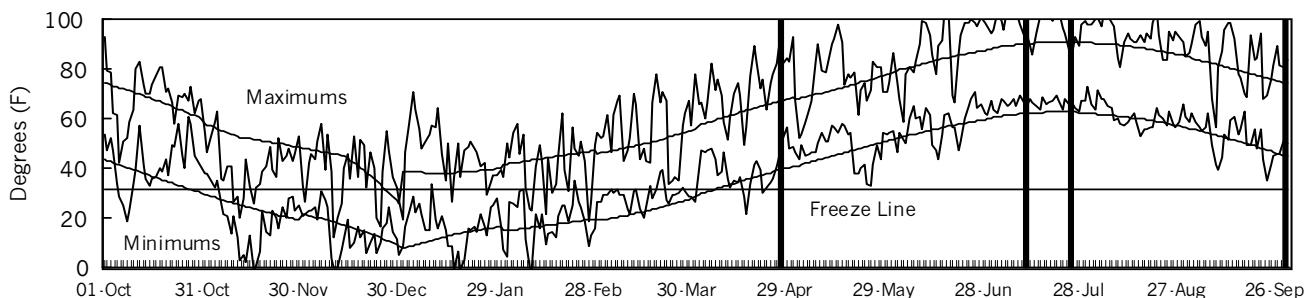

2001 GROWING CONDITIONS:

Adequate topsoil moisture allowed good stand establishment. However, approximately 50% of normal precipitation was received from mid-May to early September. The dry conditions severely limited yields and increased variability. Spider mites were present, but the extent of damage is unknown.

WEST CENTRAL KANSAS STANDARD CORN TEST, NO-TILL DRYLAND

COUNTY: GREELEY

LOCATION: Southwest Research-Extension Center, Tribune

TEST SITE: Ulysses silt loam

2000 CROP: Wheat

1999 CROP: Fallow

FERTILIZER (lbs/acre): 120 N 20 P₂O₅ 0 K₂O

PLANTING DATE: 5/10/01

HARVEST DATE: 9/25/01

COOPERATORS: Alan Schlegel, agronomist; Michele Sells, agricultural technician

TARGET POPULATION: 17,000 plants/acre, 12.3 in. spacing

FINAL STAND (% of target): 120

SILK DATES: 7/17/01 - 7/28/01

YIELD: Avg. (bu/a): 84 Range (bu/a): 57 - 102

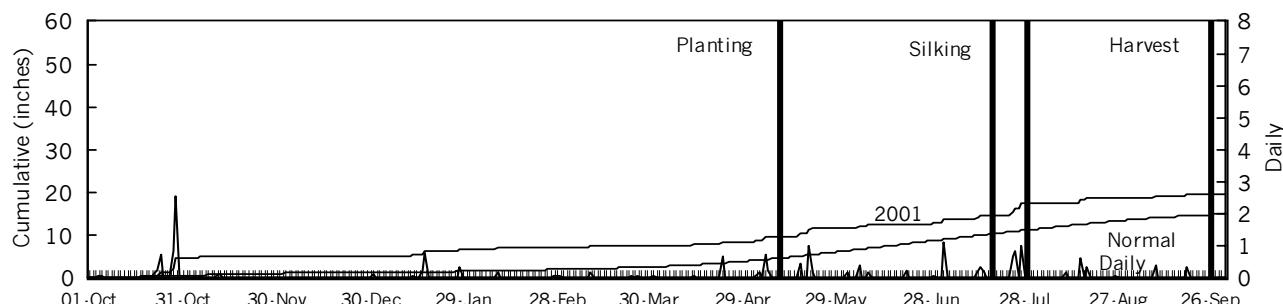

LSD (bu/a): 11 CV (%): 9

CORN BORERS: (susc. hybrid)	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		

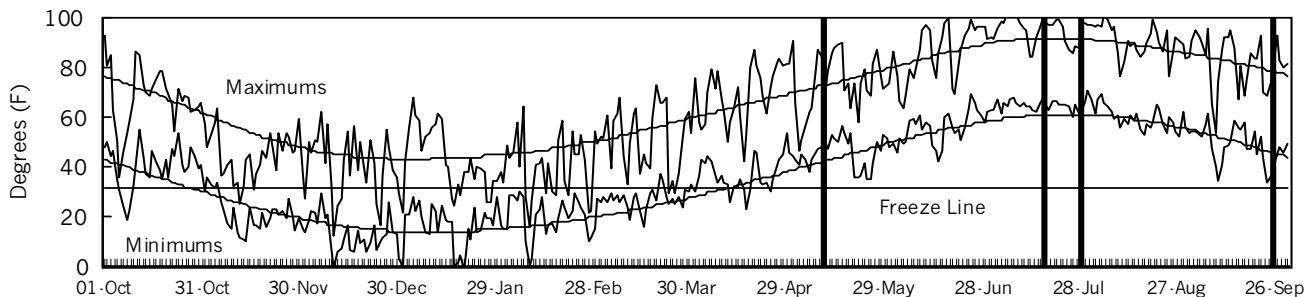

2001 GROWING CONDITIONS:

Good moisture at planting and favorable planting conditions resulted in excellent stands. High temperatures during July caused some stress. Yields were well above last year, but didn't reach the level of 1999.

Values beside bars indicate the number of comparisons with checks. Symbols (+,-) indicate if statistically higher or lower than mean of checks.

SOUTH CENTRAL KANSAS STANDARD CORN TEST ON SILT LOAM, IRRIGATED

COUNTY: MCPHERSON

LOCATION: Inman, Kansas

TEST SITE: Crete silt loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 187 N 58 P₂O₅ 0 K₂O

PLANTING DATE: 4/12/01

HARVEST DATE: 9/3/01

COOPERATORS: Kraig Roozeboom, agronomist; Fred Seiler, cooperator

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 82

SILK DATES: 6/25/01 - 6/30/01

YIELD: Avg. (bu/a): 180 Range (bu/a): 158 - 199

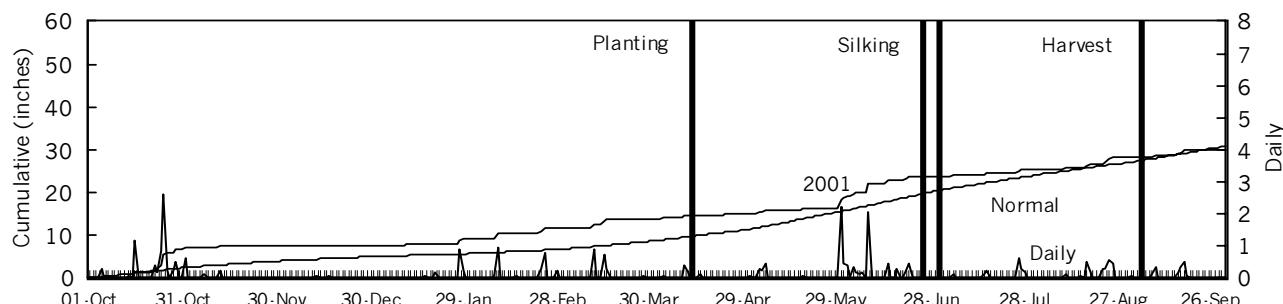

LSD (bu/a): 16 CV (%): 6

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

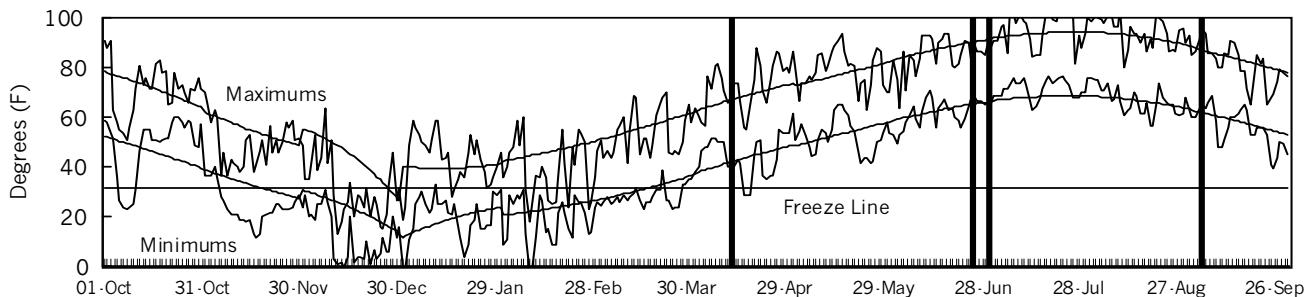

2001 GROWING CONDITIONS:

A firm, moist seedbed enabled the test to get off to a fast start. Weed control was excellent. The test developed rapidly and finished silking by July 1. Extremely hot temperatures in August hastened grain fill and dry down.

SOUTH CENTRAL KANSAS STANDARD CORN TEST ON SANDY LOAM, IRRIGATED

COUNTY: STAFFORD

LOCATION: Russell & Son Farms, St. John

TEST SITE: Naron loamy fine sand

2000 CROP: Corn

1999 CROP: Corn

FERTILIZER (lbs/acre): 175 N 0 P₂O₅ 0 K₂O

PLANTING DATE: 5/3/01

HARVEST DATE: 9/27/01

COOPERATORS: Victor Martin, agronomist; Ron Cunningham and Jeff Scott, technicians

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 109

SILK DATES: 7/7/01 - 7/15/01

YIELD: Avg. (bu/a): 188 Range (bu/a): 149 - 236

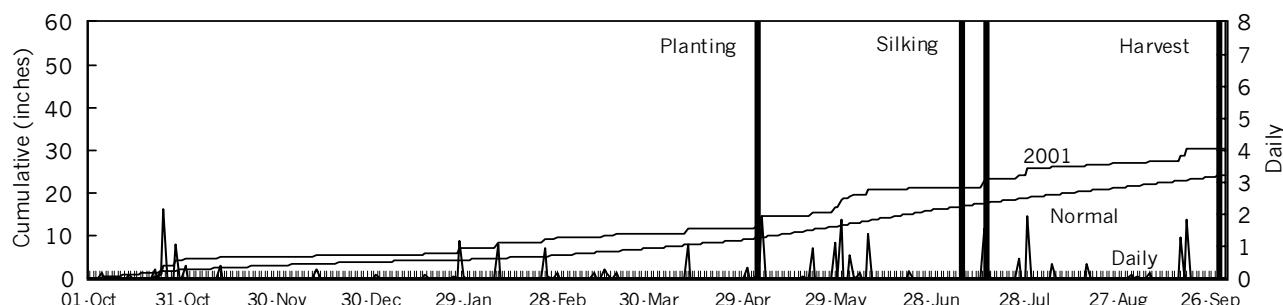

LSD (bu/a): 21 CV (%): 8

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	0	33	2.3	9/13/01

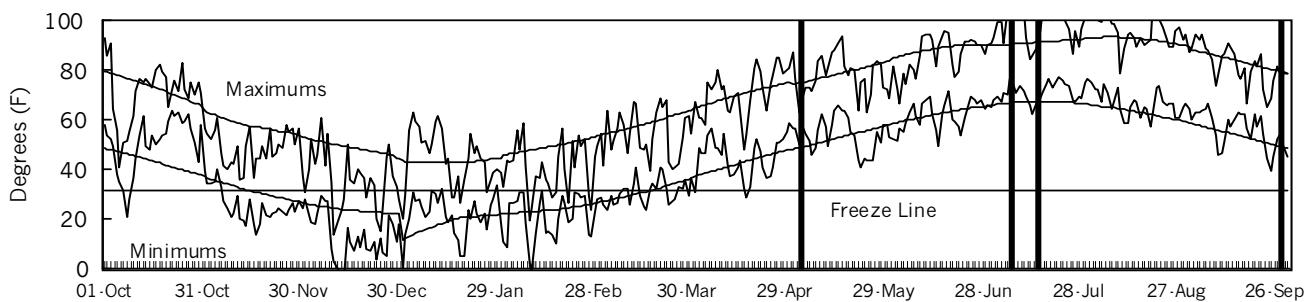

2001 GROWING CONDITIONS:

The test was planted under sprinkler irrigation on a cooperating farmer's field. Spring rains delayed planting somewhat, but good stands were obtained and reasonable yields resulted. The cool, wet spring was followed by hot, dry weather in late June and July.

NORTHWESTERN KANSAS STANDARD CORN TEST, IRRIGATED

COUNTY: THOMAS

LOCATION: Northwest Research-Extension Center, Colby

TEST SITE: Keith silt loam

2000 CROP: Soybean

1999 CROP: Sunflower

FERTILIZER (lbs/acre): 250 N 30 P₂O₅ 0 K₂O

PLANTING DATE: 5/1/01

HARVEST DATE: 10/11/01

COOPERATORS: Patrick Evans, agronomist

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 114

SILK DATES: 7/13/01 - 7/23/01

YIELD: Avg. (bu/a): 246 Range (bu/a): 211 - 282

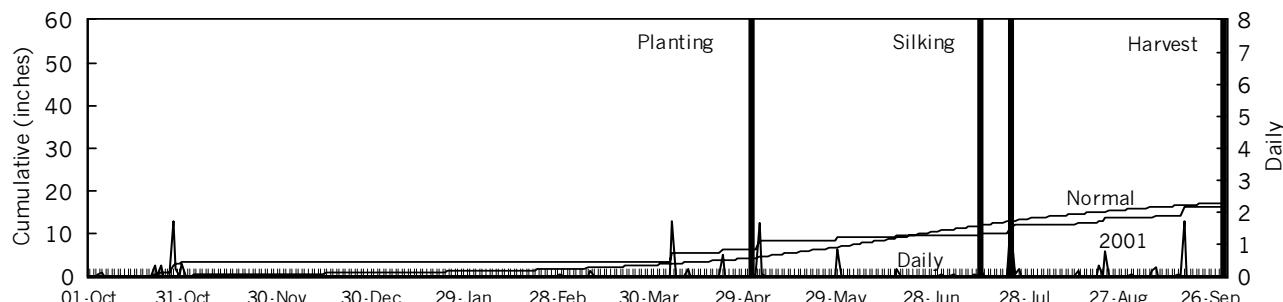

LSD (bu/a): 19 CV (%): 5

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

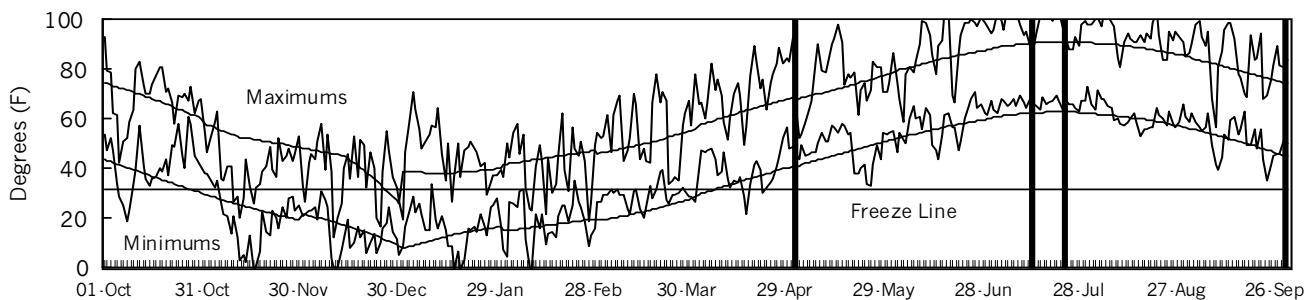

2001 GROWING CONDITIONS:

Good stands were established in all plots. Excellent irrigated growing conditions resulted in outstanding yields. Hot, dry conditions were moderated by periods of less extreme temperatures. Diseases and insects caused no noticeable yield reduction. Spider mites were controlled with an insecticide application on July 20.

WEST CENTRAL KANSAS STANDARD CORN TEST, IRRIGATED

COUNTY: GREELEY

LOCATION: Southwest Research-Extension Center, Tribune

TEST SITE: Ulysses silt loam

2000 CROP: Sorghum

1999 CROP: Sorghum

FERTILIZER (lbs/acre): 166 N 20 P₂O₅ 0 K₂O

PLANTING DATE: 5/10/01

HARVEST DATE: 10/3/01

COOPERATORS: Alan Schlegel, agronomist; Michele Sells, agricultural technician

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 112

SILK DATES: 7/19/01 - 7/26/01

YIELD: Avg. (bu/a): 213 Range (bu/a): 170 - 239

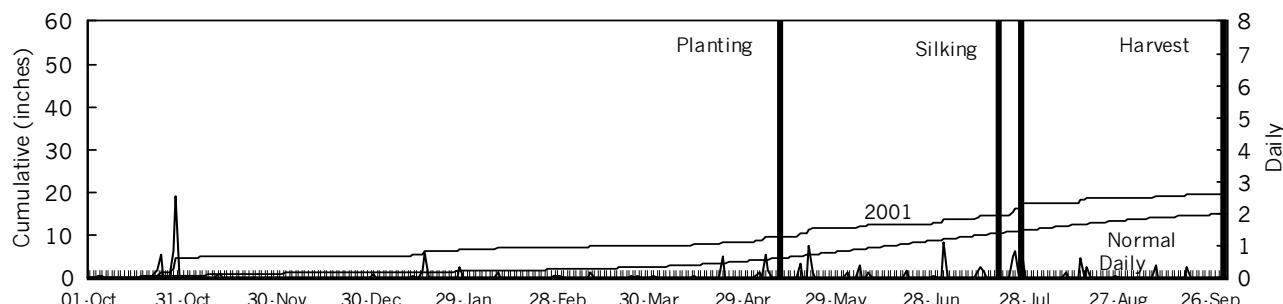

LSD (bu/a): 23 CV (%): 8

CORN BORERS: (susceptible hybrid)	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
20	0	0.4	10/2/01	

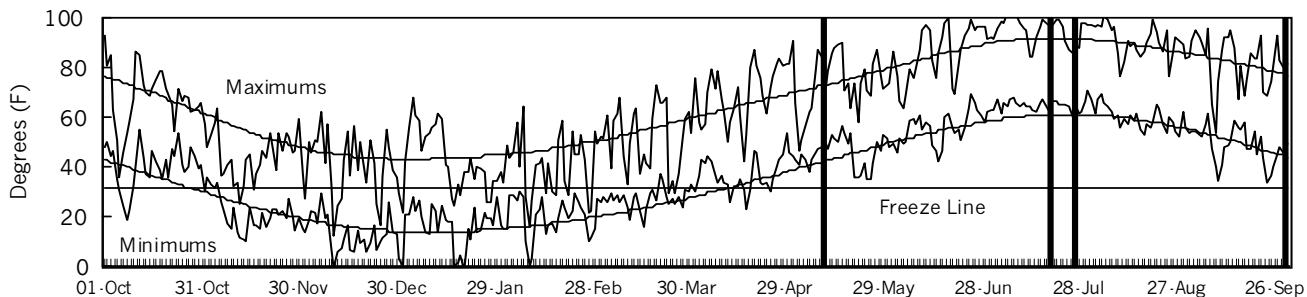

2001 GROWING CONDITIONS:

Spring weather favored establishment and early growth. Hot July temperatures caused some stress. Adequate irrigation resulted in excellent yields.

SOUTHWESTERN KANSAS STANDARD CORN TEST, IRRIGATED

COUNTY: FINNEY

LOCATION: Southwest Research-Extension Center, Garden City

TEST SITE: Keith silt loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 180 N 0 P₂O₅ 0 K₂O

PLANTING DATE: 5/1/01

HARVEST DATE: 10/11/01

COOPERATORS: Merle Witt, agronomist

TARGET POPULATION: 30,000 plants/acre, 7.0 in. spacing

FINAL STAND (% of target): 91

SILK DATES: 7/12/01 - 7/19/01

YIELD: Avg. (bu/a): 192 Range (bu/a): 124 - 227

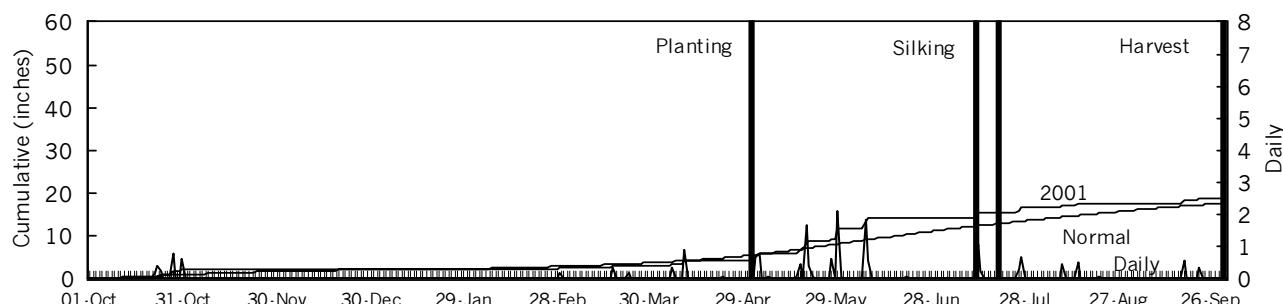

LSD (bu/a): 19 CV (%): 7

CORN BORERS: (susceptible hybrid)	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
30	40	4.4	9/27/01	

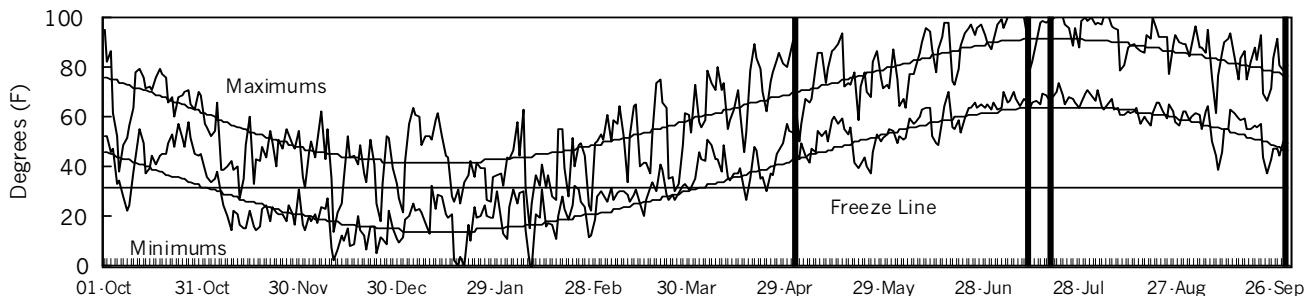

2001 GROWING CONDITIONS:

A wet, cool spring was followed by a hot, dry summer. Southwestern corn borer burrowing caused some lodging, but it was not severe. No insecticide was applied. Maize dwarf mosaic may have been present, but it was not confirmed.

Values beside bars indicate the number of comparisons with checks. Symbols (+,-) indicate if statistically higher or lower than mean of checks.

EAST CENTRAL KANSAS SHORT-SEASON CORN TEST

COUNTY: FRANKLIN

LOCATION: East Central Kansas Experiment Field, Ottawa

TEST SITE: Woodson silt loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 111 N 35 P₂O₅ 0 K₂O

PLANTING DATE: 4/24/01

HARVEST DATE: 9/11/01

COOPERATORS: Keith Janssen, agronomist; Jim Kimball, technician

TARGET POPULATION: 22,000 plants/acre, 9.5 in. spacing

FINAL STAND (% of target): 109

SILK DATES: 6/28/01 - 7/5/01

YIELD: Avg. (bu/a): 90 Range (bu/a): 74 - 112

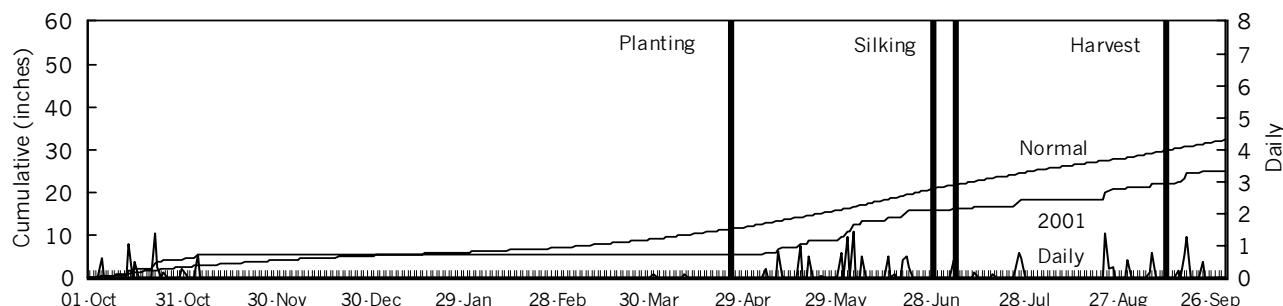

LSD (bu/a): 12 CV (%): 9

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	--	--	--	--

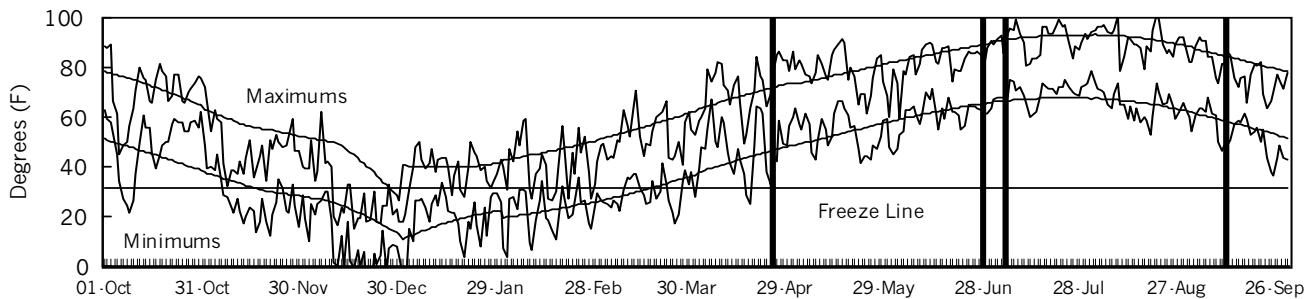

2001 GROWING CONDITIONS:

Excellent planting conditions resulted in good stands for all entries. Early growth was good, but dry conditions in late June and July limited yields. Lodging was minimal.

SOUTHEASTERN KANSAS SHORT-SEASON CORN TEST

COUNTY: CRAWFORD

LOCATION: Four-State Farm Show, Pittsburg

TEST SITE: Parsons silt loam

2000 CROP: Soybean

1999 CROP: Corn

FERTILIZER (lbs/acre): 140 N 70 P₂O₅ 70 K₂O

PLANTING DATE: 3/27/01

HARVEST DATE: 8/17/01

COOPERATORS: James Long, agronomist

TARGET POPULATION: 22,000 plants/acre, 9.5 in. spacing

FINAL STAND (% of target): 109

SILK DATES: 6/14/01 - 6/20/01

YIELD: Avg. (bu/a): 152 Range (bu/a): 123 - 173

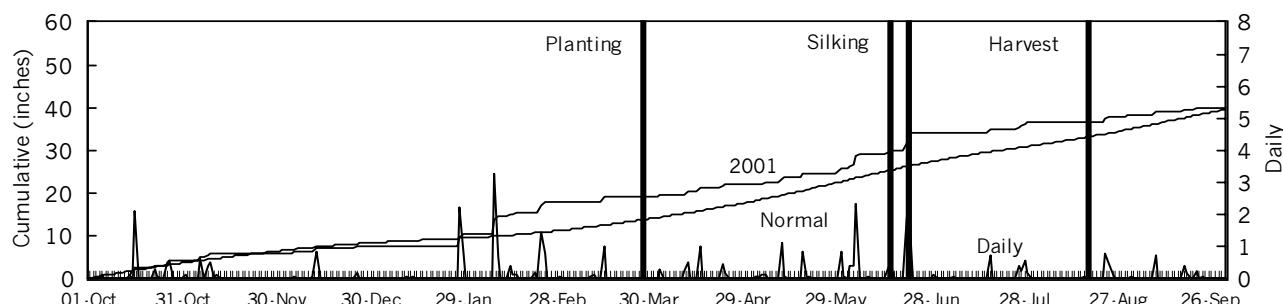

LSD (bu/a): 13 CV (%): 6

CORN BORERS:	Infestation (% plants)		Tunnels (in./plant)	Sample date
	ECB	SWCB		
(susceptible hybrid)	25	0	0.7	8/16/01

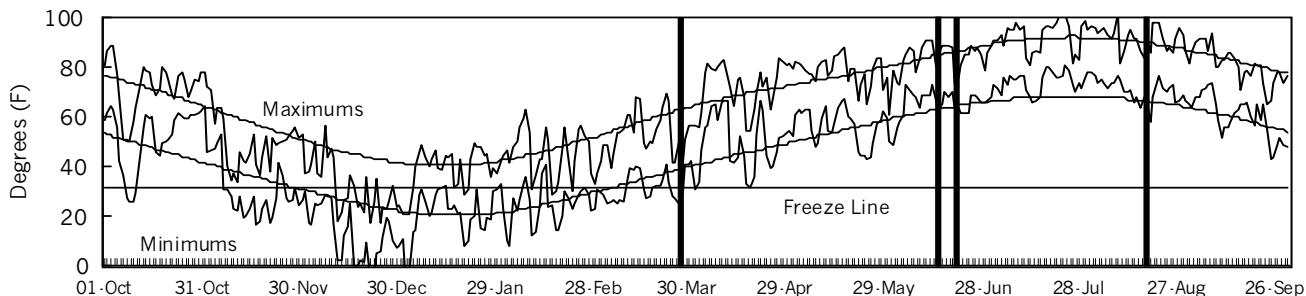

2001 GROWING CONDITIONS:

Excellent soil moisture and soil condition at planting resulted in good stands. Generally cool spring temperatures combined with adequate rainfall got the test off to a good start. However, after the second week in July drought conditions prevailed.

¹ Average performance standardized to mean of check hybrids. Adjusted to 15.5% moisture.

² N = Number of comparisons with checks; mean estimates were calculated only for those with at least 5 comparisons.

+ Statistically significantly higher than the mean of the check hybrids (P < 0.5).

- Statistically significantly lower than the mean of the check hybrids (P < 0.5).

ELECTRONIC ACCESS

For those interested in accessing crop performance testing information electronically, try visiting our World Wide Web site. Most of the information contained in this publication is available for viewing or downloading. The URL is <http://www.ksu.edu/kscpt>.

Excerpt from the

UNIVERSITY RESEARCH POLICY AGREEMENT WITH COOPERATING SEED COMPANIES*

Permission is hereby given to Kansas State University to test varieties and/or hybrids designated on the attached entry forms in the manner indicated in the test announcements. I certify that seed submitted for testing is a true sample of the seed being offered for sale.

I understand that all results from Kansas Crop Performance Tests belong to the University and the public and shall be controlled by the University so as to produce the greatest benefit to the public. Performance data may be used in the following ways: 1) Tables may be reproduced in their entirety provided the source is referenced and data are not manipulated or reinterpreted; 2) Advertising statements by an individual company about the performance of its entries may be made as long as they are accurate statements about the data as published, with no reference to other companies' names or cultivars. In both cases, the following must be included with the reprint or ad citing the appropriate publication number and title: "See the official Kansas State University Agricultural Experiment Station and Cooperative Extension Service Report of Progress 869 '2000 Kansas Performance Tests with Soybean Varieties', or the Kansas Crop Performance Test website, <http://www.ksu.edu/kscpt>, for details. Endorsement or recommendation by Kansas State University is not implied."

These materials may be freely reproduced for educational purposes. All other rights reserved. In each case, give credit to the author(s), name of work, Kansas State University, and the date the work was published.

ACKNOWLEDGMENTS

Cooperation of Research Center and Experiment Field personnel who furnished land and performed many or all of the field operations is sincerely appreciated. Technicians Edward O. Quigley and James R. Cochrane packaged seed and performed field operations for some of the tests. Student worker Jared Meier helped with seed counting, sign painting, and plot maintenance. Mary Knapp of the Weather Data Library provided much of the climatological information.
